Acceleration of Charged Particles

Conventional accelerators:

RF accelerators have limited acceleration gradient because of RF cavities maximum field. The limit of the order of **100 MeV/m** due to electrical breakdown in resonant cavities

Plasma wakefields accelerators:

Use of plasma (ionized) as an accelerating medium overcomes the breakdown limits of the RF cavities and gradients above **1 up to 100 GeV/m** have been demonstrated

$$E_{WB} = \frac{m_e c}{e} \omega_{pe} \quad \text{where} \quad \omega_{pe} = \sqrt{\frac{n_{pe} e^2}{\epsilon_0 m_e}}$$

scale

$$E_{WB} \propto 100 \sqrt{n_{pe}}$$

$$n_{pe} \approx 10^{14} - 10^{18} \text{ cm}^{-3}$$

Plasma Wakefield Acceleration

- A **driver** can be
 - ultra-short, high-intensity **laser pulse**,
 - short relativistic **bunch of - or + charged particles**
- The driver generates a **radial transverse force**
 - Expel or attract plasma electrons
 - Leads to a **periodic e- oscillation**
 - **Wakefields**

- To drive wakefields $E \gg 1 \text{ GV/m}$; Need the driver
 - Longitudinal size σ_t **smaller than** λ_{pe} plasma wavelength
 - Transverse size σ_r **smaller than** k_{pe}^{-1} (plasma skin depth)

$$\sigma_t \sim 4 \text{ ps} (\leq \lambda_{pe} = 2\pi c/\omega_{pe} \sim 1 - 3 \text{ mm})$$

$$\sigma_r \leq \frac{c}{\omega_{pe}} \simeq 200 \text{ } \mu\text{m}$$

$$\rightarrow E_{WB} \propto \frac{1}{\sigma_t}$$

Plasma Wakefield Acceleration

The **Driver** travels in the plasma to **induce** a modulation of the plasma electron density that sustains longitudinal and transverse fields which are called **wakefields**

↳ >1 GV/m wakefield can be used to accelerate particles

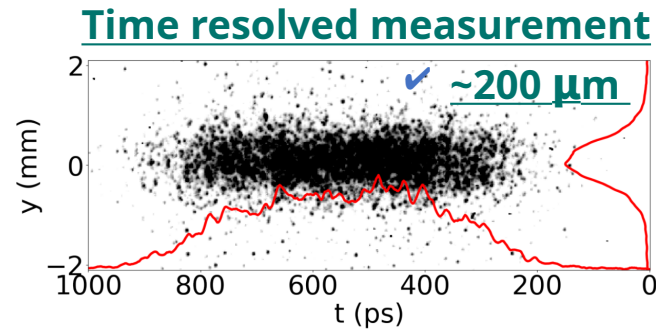

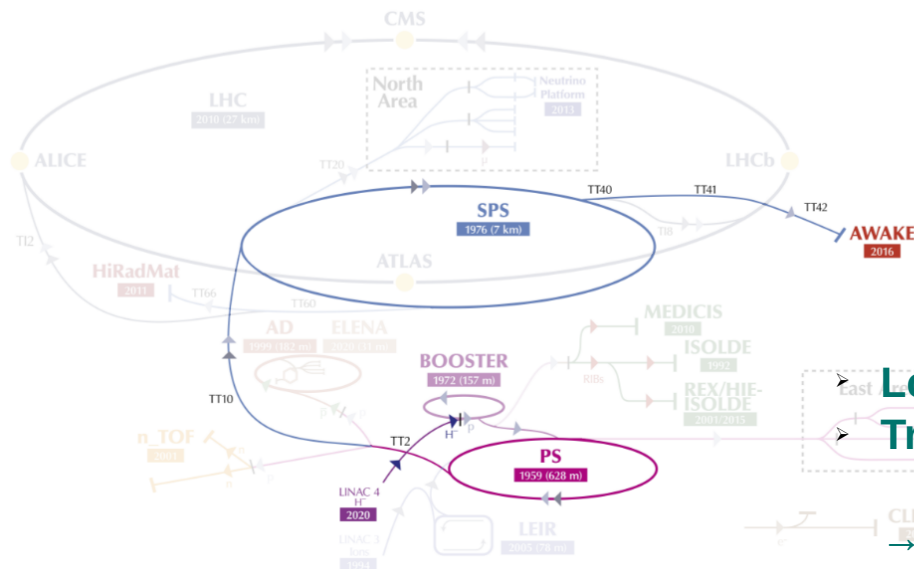

- ↳ **AWAKE:**
- CERN SPS proton bunch as driver of wakefields
 - Accelerate externally injected electron witness bunch
~MeV to GeV

$$E_{WB} \propto \frac{1}{\sigma_t}$$

$$E_{WB} \propto 100 \sqrt{n_{pe}}$$

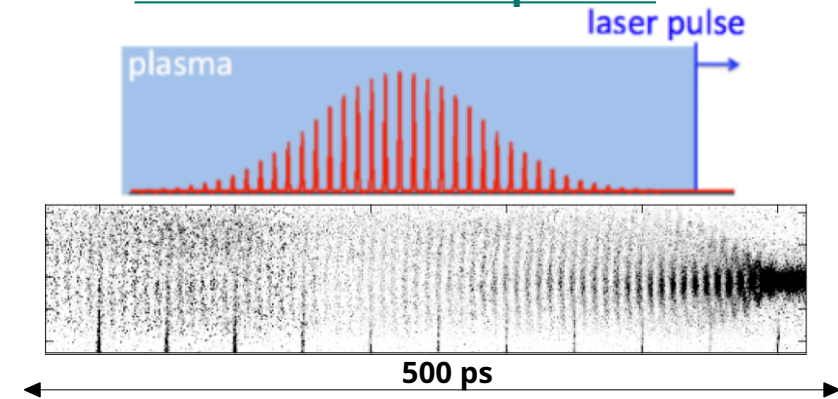

AWAKE is a Plasma Wakefield Acceleration experiment using a **proton driver**

CERN Synchrotron SPS as Driver (400 GeV):

\times **200 ps (6 cm)**
(>> 4 ps ~ mm)

Self-Modulation in plasma

Long p^+ bunch propagating in plasma is subject to **Self-Modulation (SM)** instability.
Transform driver bunch into a **train of shorter bunches** with a periodicity λ_{pe} .

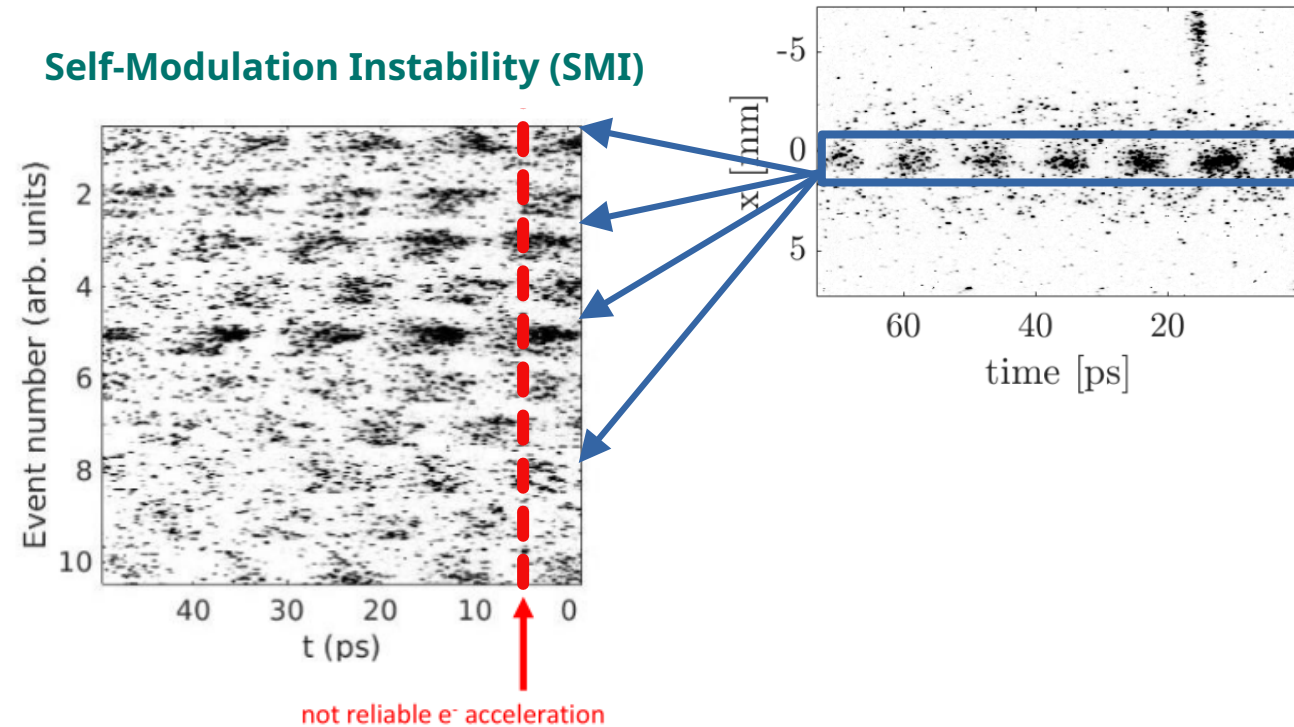

The micro-bunch train can then resonantly excite large amplitude wakefields.

AWAKE is a Plasma Wakefield Acceleration experiment using a **proton driver**

Controlled Self Modulation (SM) → Seed

- ✓ Relative **phase** of the wakefields control
- ✓ Deterministic injection to accelerate a witness bunch

Self-Modulation Instability (SMI)

AWAKE is a Plasma Wakefield Acceleration experiment using a **proton driver**

Controlled Self Modulation (SM) → Seed

- ✓ Relative **phase** of the wakefields control
- ✓ Deterministic injection to accelerate a witness bunch

AWAKE has recently demonstrated [1] that the SM process does indeed transform a long proton bunch ($\sigma_t > 200$ ps) into a train of micro-bunches with period $2\pi/\omega_{pe}$ (< 10 ps)

[1] AWAKE collaboration,
Acceleration of electrons in the plasma wakefield of a proton bunch,
Nature 561, 363–367 (2018)

Self-Modulation Instability (SMI)

not reliable e⁻ acceleration

Seeded Self-Modulation (SSM)

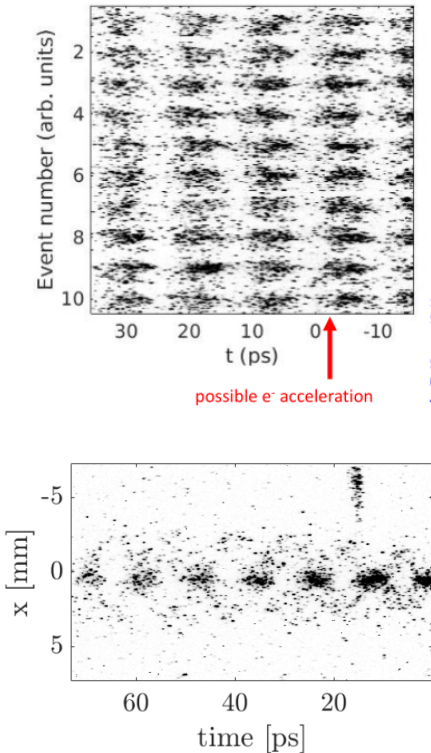

possible e⁻ acceleration

Acceleration Towards a (scalable) Accelerator

✔ ➤ **AWAKE Run 1 → Demonstrate and study the seeded self-modulation**

Seeded Self-Modulation (SSM)

$$f_{mod} = f_{pe} \propto \sqrt{n_{pe}}$$

19 MeV => 2 GeV

Acceleration of electrons in the plasma wakefield of a proton bunch, *Nature* 561, 363–367 (2018)

Bachmann, A. M., & Muggli, P. (2020). JACoW: Beam Diagnostics in the Advanced Plasma Wakefield Experiment AWAKE.

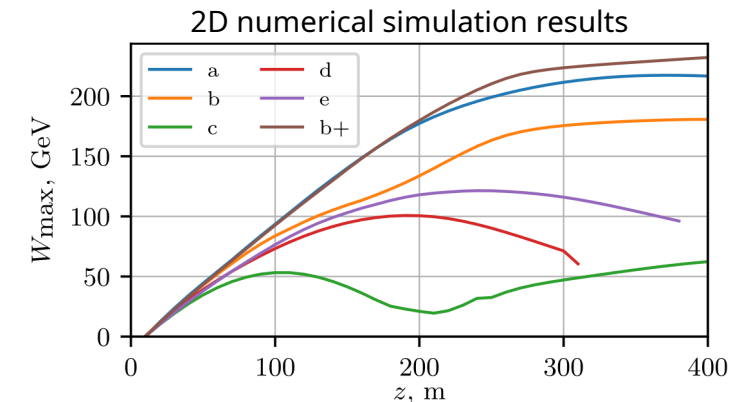

Acceleration Towards a (scalable) Accelerator

- ✓ ➤ **AWAKE Run 1** → Demonstrate and study the seeded self-modulation
- now ➤ **AWAKE Run 2:** → Transition from proof-of-principle to applications

200 GeV in 200 m

K. V. Lotov & P. V. Tuev, *Plasma Phys. and Control. Fusion*, 63, 125027 (2021)

- Possible first applications for particle physics experiments with 50-200 GeV electron bunches

Acceleration Towards a (scalable) Accelerator

- ✓ ➤ **AWAKE Run 1** → Demonstrate and study the seeded self-modulation
- now** ➤ **AWAKE Run 2:** → Transition from proof-of-principle to applications

Run 2 in 4 phases:

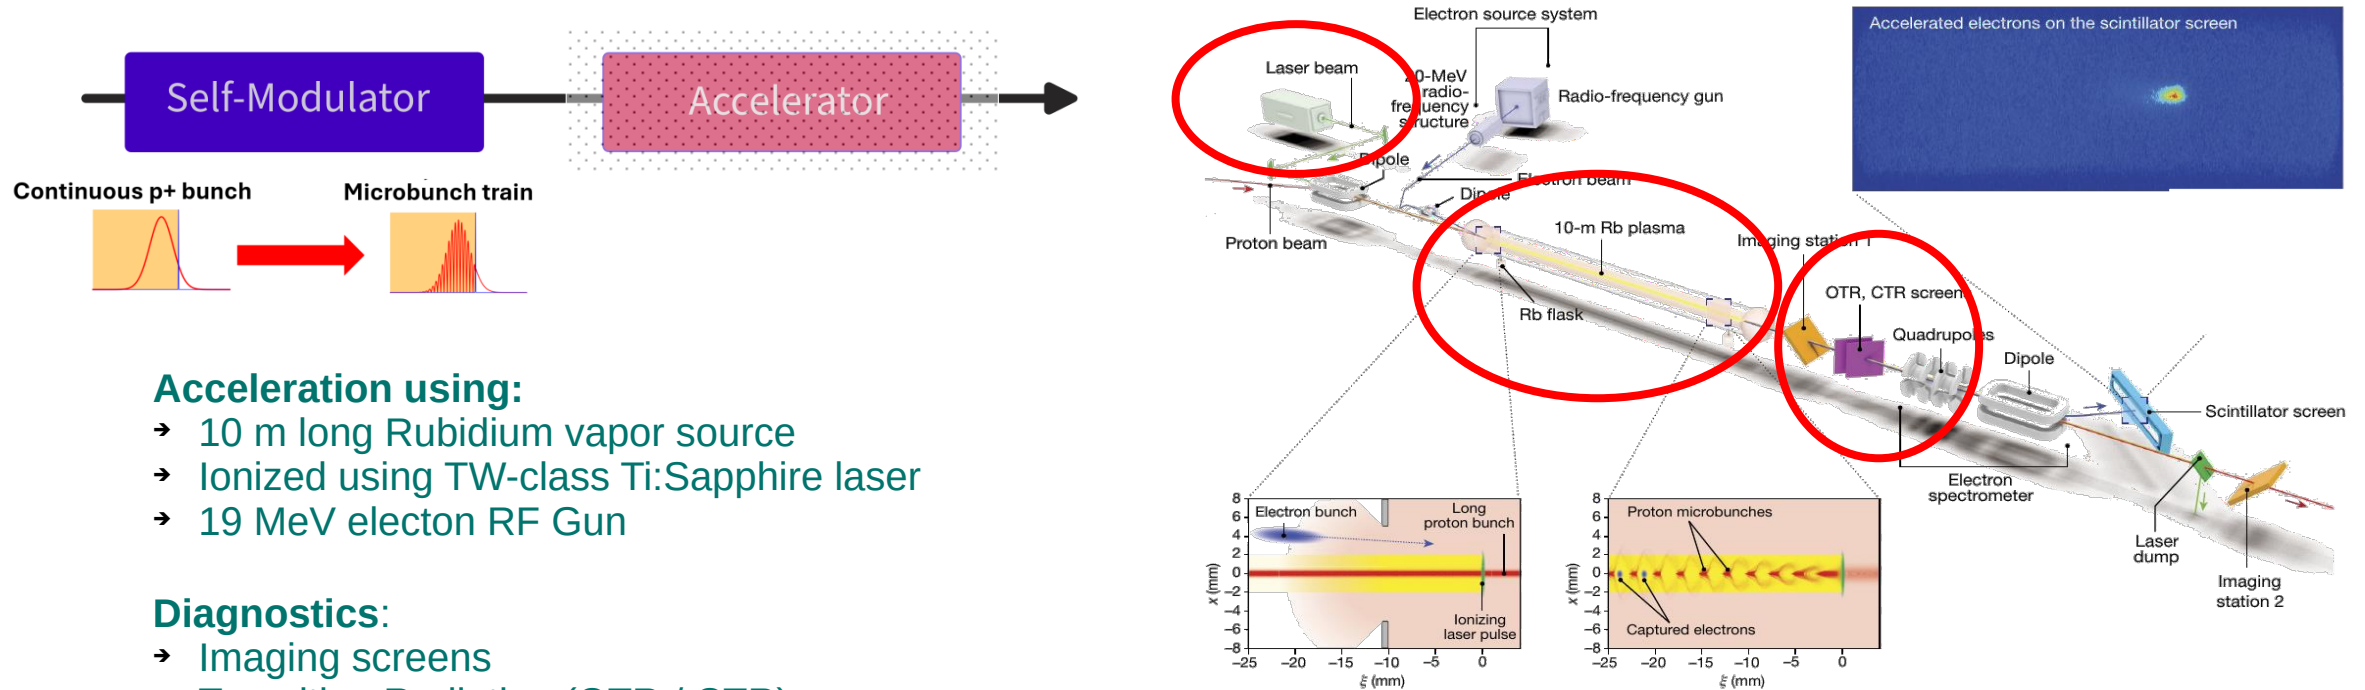

- ✓ • **Run 2a:** Demonstrate the **seeding** of the self-modulation of the entire proton bunch with an **electron bunch**
- ✓ • **Run 2b:** **Maintain large wakefield amplitudes** over long plasma distances by introducing a **step** in the plasma density

- 2029** • **Run 2c** *: Demonstrate electron acceleration and **emittance control** of externally injected electrons
- 2032** • **Run 2d** *: Development of **scalable plasma** sources to 100s meters length with sub-% level plasma density uniformity.

Current Layout and Contributions of MPP

Acceleration using:

- 10 m long Rubidium vapor source
- Ionized using TW-class Ti:Sapphire laser
- 19 MeV electron RF Gun

Diagnostics:

- Imaging screens
- Transition Radiation (OTR / CTR) screens
- Scintillators screen
- Streak cameras
- Interferometers
- ...

Plasma Source Upgrade

Impose temperature/plasma density step

- Explore the effect of a plasma density on
 - micro-bunch train
 - bunch halo
 - plasma light from dissipation of wakefields
 - Energy gain
 - Hosing
 - ...

Numerical simulation

- Amplitude of wakefields larger w/ plasma density step
- Optimum position and amplitude of the step

K V Lotov, Physics of Plasmas 22, 103110 (2015)

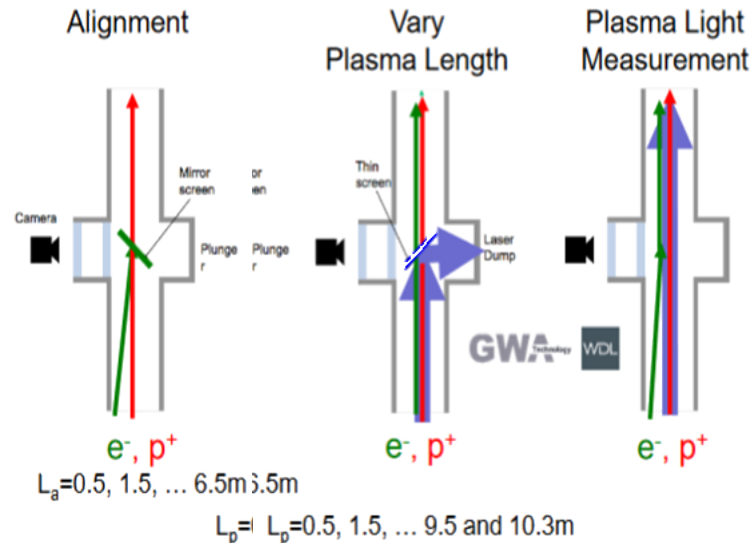

K V Lotov and P V Tuev PPFC 63 125027 (2021)

Plasma Source Upgrade, Plungers Installation

Plungers installed and commissioned on schedule in June 2024:

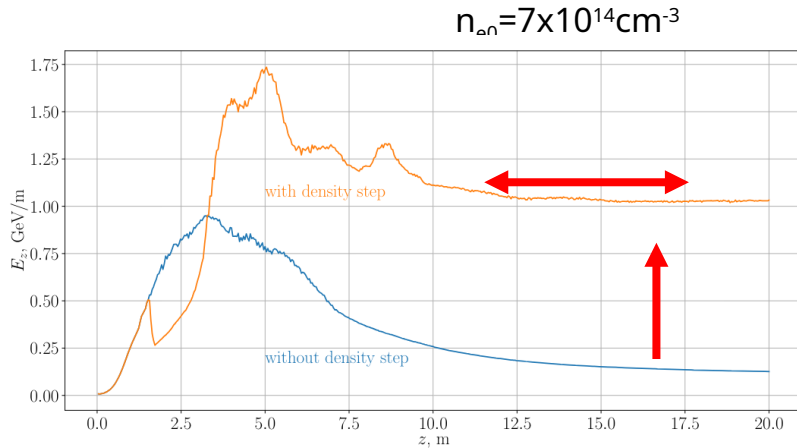

- **Align e⁻ and p⁺ beams** inside plasma source for :
 - Acceleration, side injection
 - e⁻ Seeding of Self-Modulation (e⁻ SSM)
 - e⁻ Seeding of hosing
- **Vary plasma length** to perform:
 - **Acceleration gradient** measurements
 - Growth of the wakefields
 - Growth of hosing

Plasma Density Step

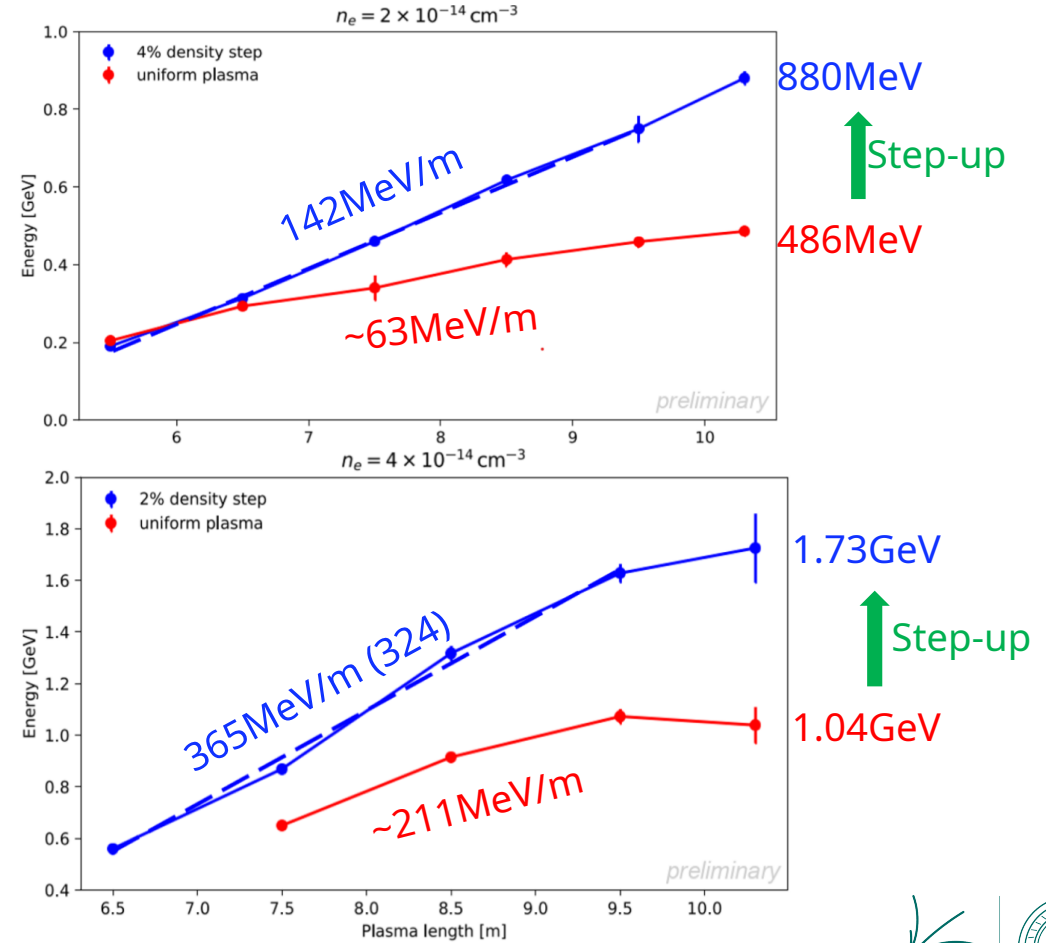

Increases energy gain, constant acceleration gradient

Plasma density (up) step to **make E_z** and **acceleration constant past the SM saturation point**

AWAKE status report 2024, <https://cds.cern.ch/record/2917426/files/SPSC-SR-356.pdf>

- **Clear increase in final energy ($L_p=10.3m$): 1.04 → 1.73GeV**
- **Clear increase in accelerating gradient: ~211 → 365MeV/m**

Dependency of saturation length on plasma density

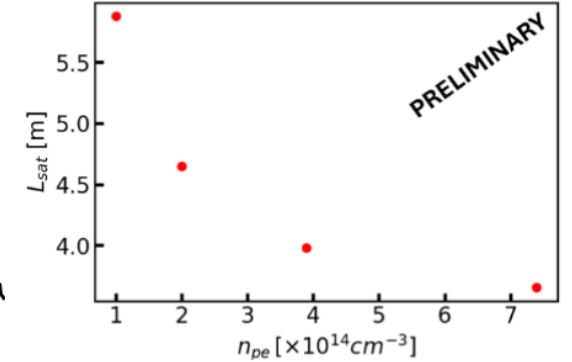

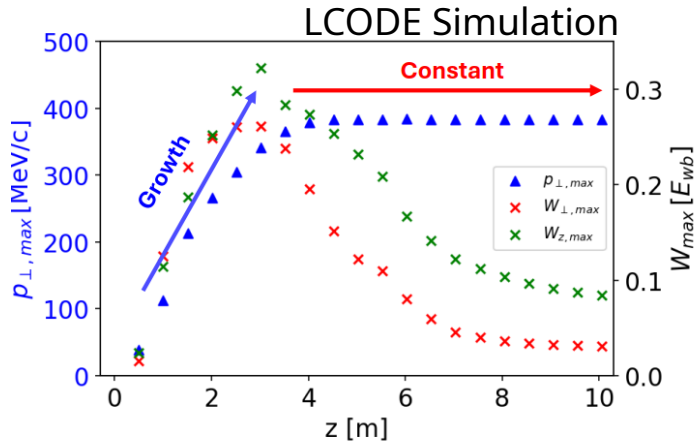

Growth of the Wakefields

SM saturates in less than 10m

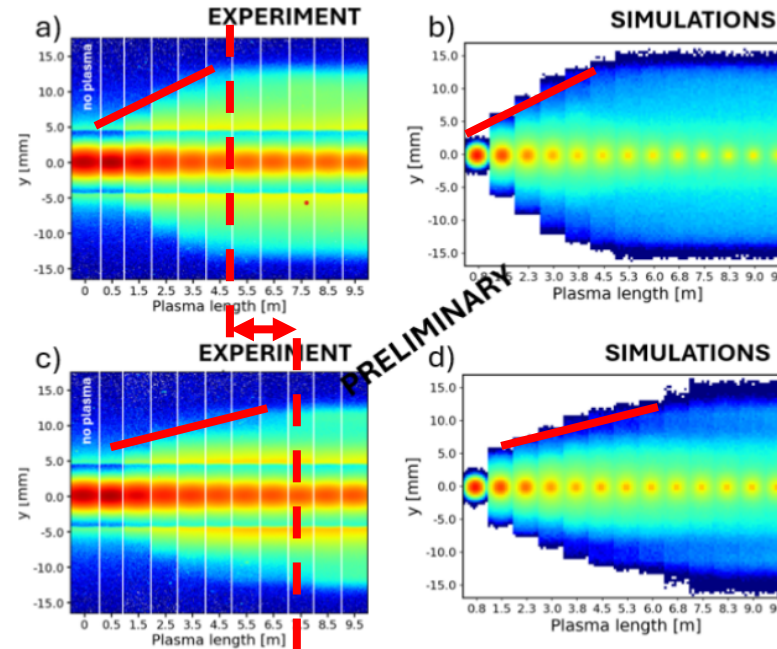

=> Self-modulator for Run 2c

- 1) SM μ B formation \rightarrow W
- 2) μ B fully formed
- 3) SM vs W \rightarrow Halo

Transverse momentum

Halo radius shows Self-Modulation saturation length

Constant density plasma

$$N_b = 3 \times 10^{11}$$

$$n_{pe} = 2 \times 10^{14}/cc$$

$$\text{RIF} + 100ps$$

Plasma with density step

$$N_b = 3 \times 10^{11}$$

$$n_{pe} = 2 \times 10^{14}/cc$$

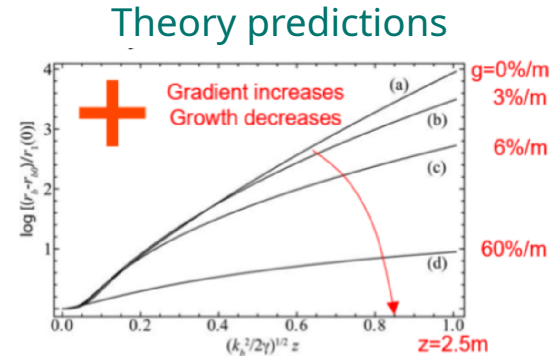

$$\text{RIF} + 100ps$$

$$4\% \text{ step}$$

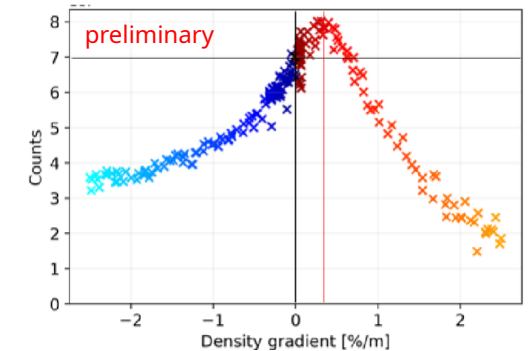

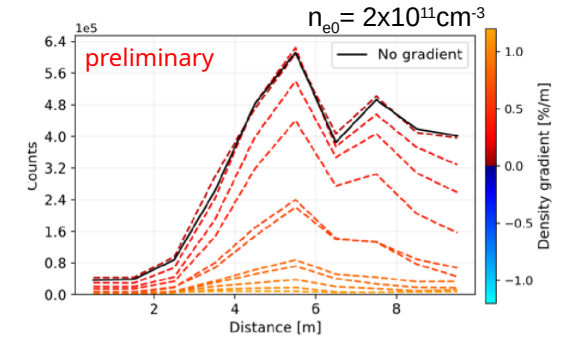

Effect of Density Gradient on Seeded Self-Modulation

SM can be detuned and suppressed by (linear) density gradients

C. B. Shroeder et al., *Phys. Plasmas* 19, 010703 (2012)

Plasma Light Measurements

- **Clear observation of SM suppression:** light, halo and time-resolved (not shown) diagnostics
- **Asymmetry** positive/negative gradients
- **Higher fields** with small positive gradient **consistent with higher energy gain observation**

MAX-PLANCK-INSTITUT
FÜR PHYSIK

Summary

- **AWAKE**
 - Plasma wakefield driven by a Self-Modulated proton bunch
 - Observed clear effect of density step
 - ✓ **Stabilization of accelerating gradient** at higher level
 - ✓ **Energy gain**
 - Growth of self-modulation & wakefields along plasma studies
 - Growth of hosing along plasma studies
- **Successful data collection providing bases for publications and studies for preparation of AWAKE future steps**
- **Clear Scientific program**
 - Run 2b: plasma density step (→ 2023-25)
 - Run 2c: external injection of e-bunch in second plasma, quality (2028→)
 - Run 2d: operation with acceleration in scalable plasma source (2030→)
- **From acceleration to an accelerator → towards applications to particle physics in 2030's**
 - Dark photon searches
 - Non-linear QED in electron-photon collisions
 - ...

Beyond AWAKE → HEP + ALIVE

AWAKE approach will provide mid-term particle physics opportunities

Investigate:

- high repetition rate proton accelerator luminosity
- short proton bunches eases plasma requirements, more efficient use of protons

Longer-term:

- for collider applications, need scheme to reach interesting luminosity
- only fraction of protons in bunch contribute to generating useful wakefield - limiting energy efficiency
- long proton bunches susceptible to hosing instability. May limit full use of proton bunch
- acceleration of electrons using many micro bunches requires very uniform plasma

Advanced Linear accelerator
for Very high Energies
