Symbols for the Large Hadron Collider

Wednesday, 17 December 2025 16:45 (45 minutes)

Advances in the understanding of Feynman integrals and their associated special functions have enabled more precise predictions for high-energy experiments. In this talk, I review calculations of phenomenologically relevant scattering amplitudes that have greatly benefited from the symbol calculus for multiple polylogarithms. In particular, I discuss cases involving algebraic alphabets.

Presenter: VON MANTEUFFEL, Andreas
