Is Spectralon, the Highest Diffuse Reflectivity Material, a Lambertian Scatterer?

Hanna Kellermann, Razmik Mirzoyan
MPI für Physik München

What is Spectralon?

- product name for diffusely reflecting material
- manufactured from PTFE (**Polytetrafluoroethylene**)
- sintered from PTFE powder
- very high diffuse reflectivity in the wavelength regime from 300-1000nm
- said to be a perfect diffusor (Lambertianen reflector)

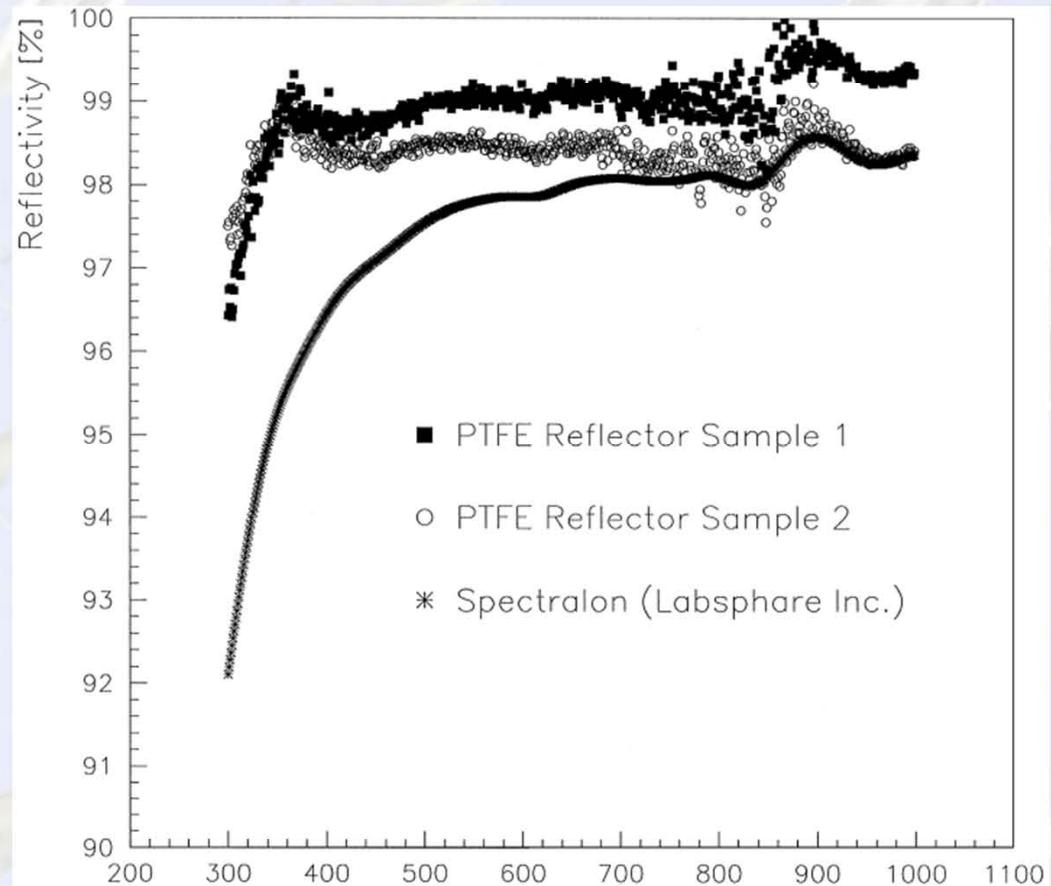

PTFE reflector manufactured in MPI

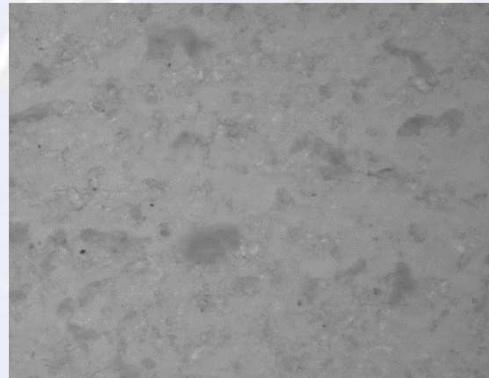

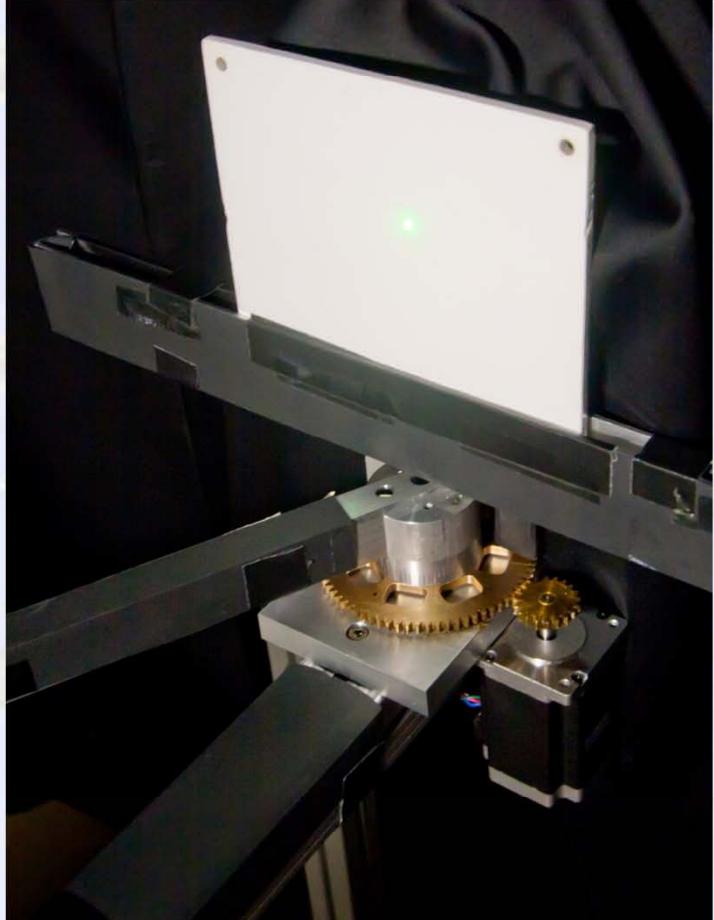

- PTFE powder HOSTAFLON
grain size : 20 μm
- sintered in the oven over 6 h
with different temperatures
- cooled down very slowly over
15 h
- can be machined into various
shapes

Achieved properties could easily
compete with those of the
commercially available reflectors

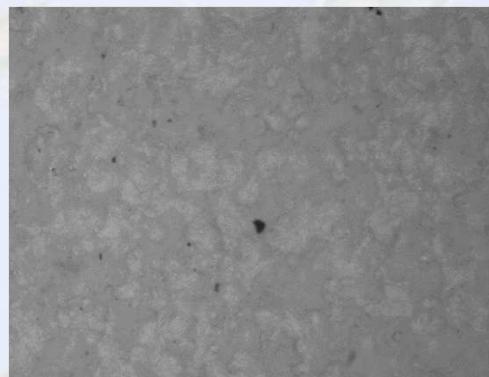

Mirzoyan, et al., 2000

Cerenkov Telescopes

scattering characteristics spectralon sample Illuminated under -30 deg

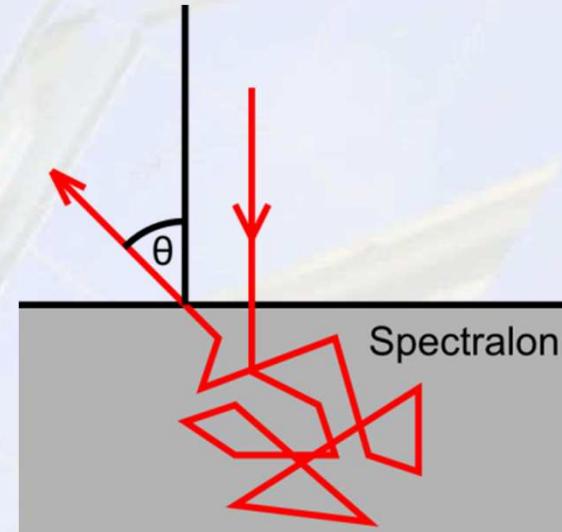

Simulation steps

2 very simple assumptions:

- penetration depth distribution according to an exponential law
- isotropic scattering at interaction point

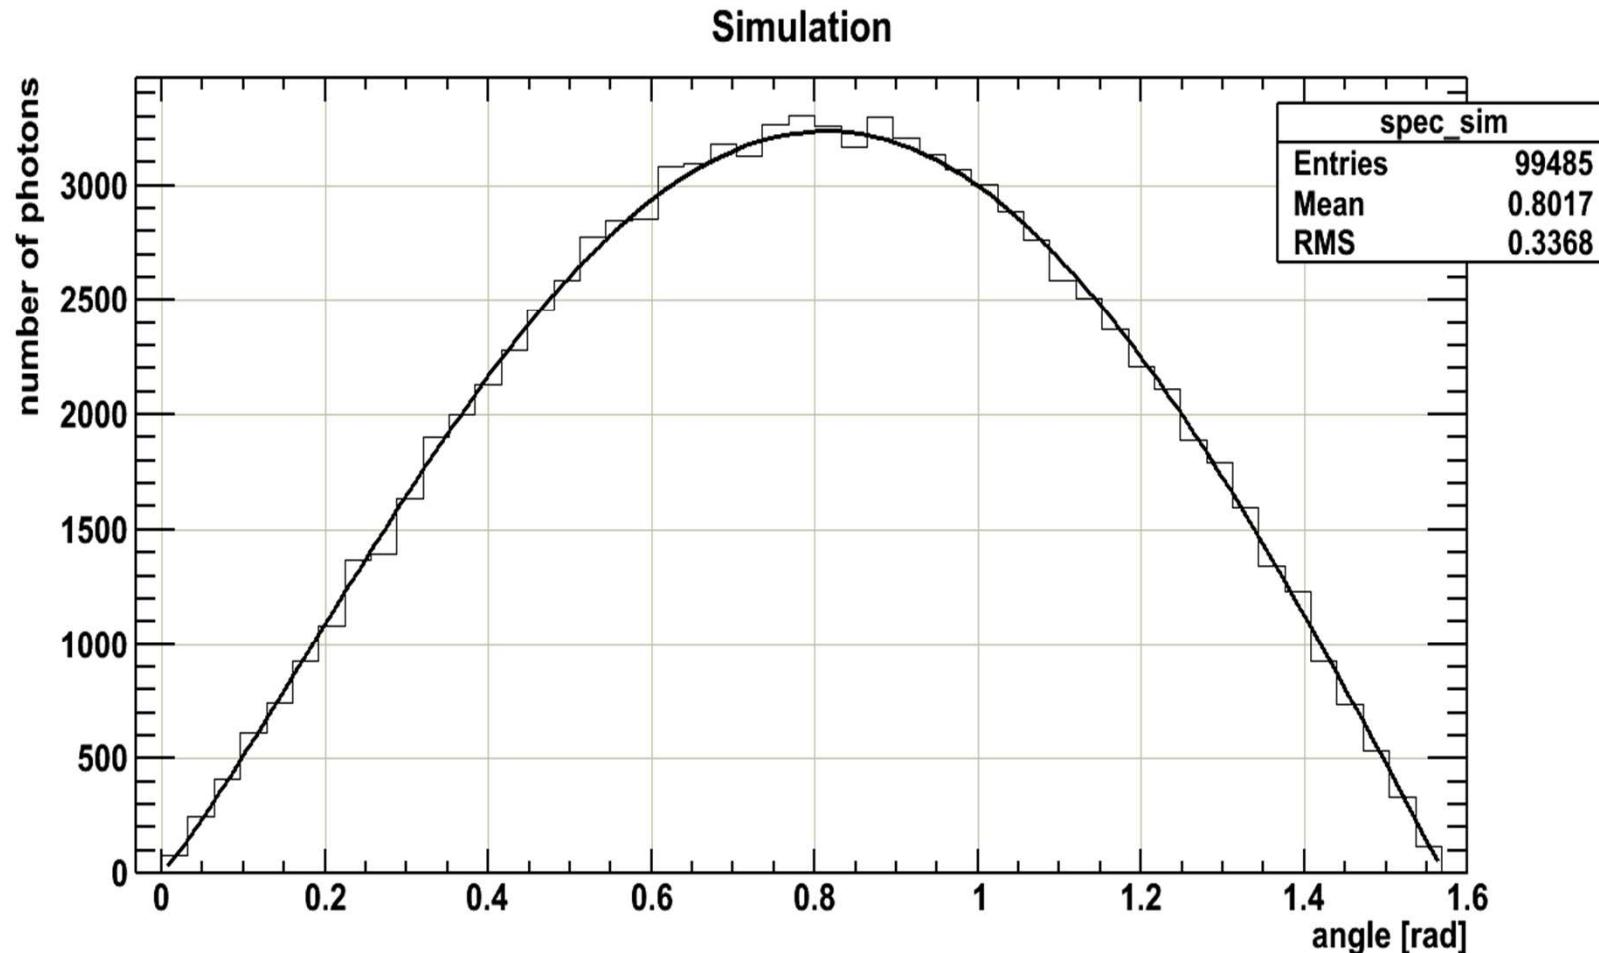

Not taken into account:

- grain size
- horizontal propagation of the light

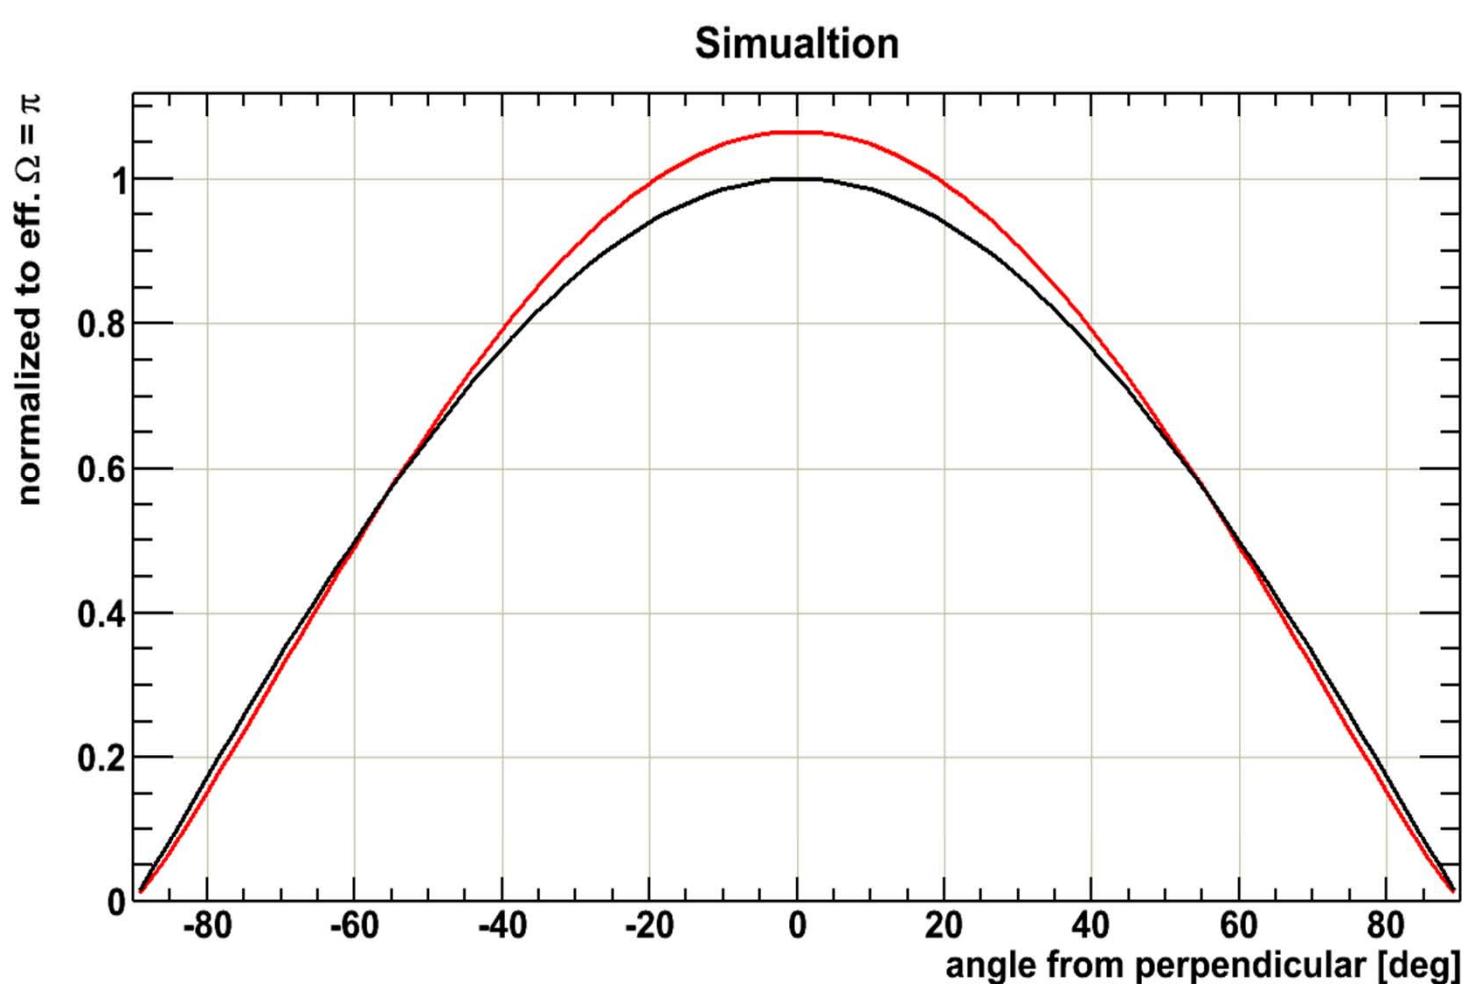

Result of the Simulation
