“Evidence for $0\nu\beta\beta$ ”

$1.2 \cdot 10^{25}$

(0.69-4.18 3σ)

H.V.Klapdor - Kleingrothaus et al

Phys. Lett. B 586 (2004)

uncertainty from Majorana CP phases

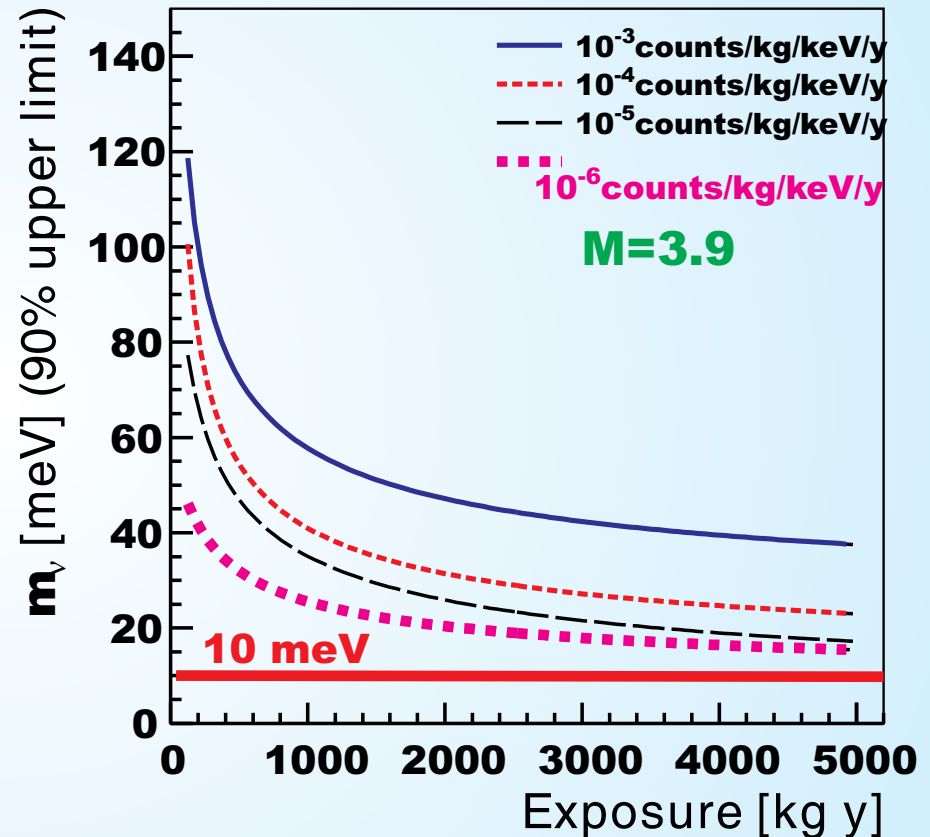

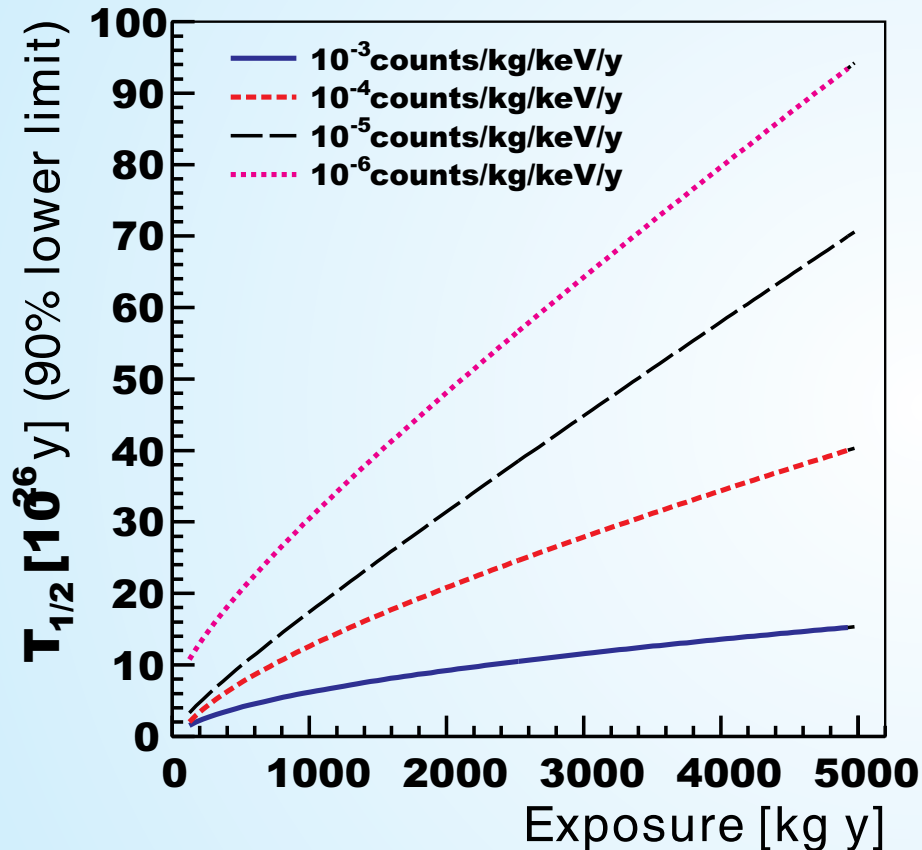

This assumes that the neutrino is purely Majorana.

Conspiracy of Majorana phases

Importance of Background

$1/T_{1/2} = \text{phase-space} \cdot \text{matrix-element} \cdot \text{coh.neutrino mass}^2$

10 meV will be very difficult, even with 5000 kg y .

Reality of Background

We need a detector with a **large mass [1ton]** and **minimal background**.

Unwanted events have many sources:

All this needs to be understood and prevented and we **focus on** .

Reality of a 1ton Ge Experiment

Of course there is no reality yet, but for the expectation of price:

~500 M€

Infrastructure

**Enrichment,
Crystal Growing,
Detector Manufacturing,
Array**

Infrastructure of the Future

Some
bad dreams.

Sphere

Can this be done?

and if, where ?

multiply the lower hall

The Goal for Detectors

Build a detector with which we can search for **neutrinoless double beta decay** and which can also be used to search for **dark matter**.

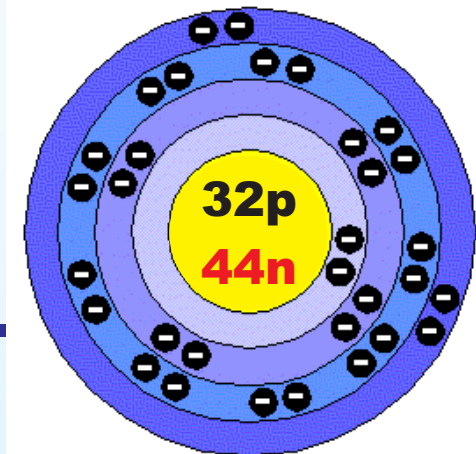

💰💰💰💰💰 **demands multi purpose**

Why Germanium (76) ?

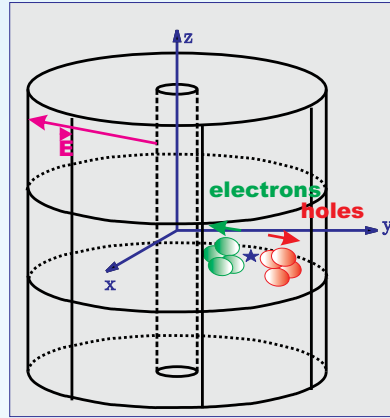

It's a semiconductor with double beta decay.

We have some experience...

How we got started

**18-fold,
(6ϕ , $3z$)
segmented
detectors**

Segmentation for background reduction

$r = 75\text{mm}$ $h = 70\text{mm}$

1.6 kg Ge in 34 g of Cu

7 g of Teflon

Kapton cables \rightarrow PEN

with Cu snap contacts

Segmentation

$0\nu\beta\beta$

γ or 2γ

**reduces
background
by factor 10**

**localized deposit
single site event**

**several deposits
multi site event**

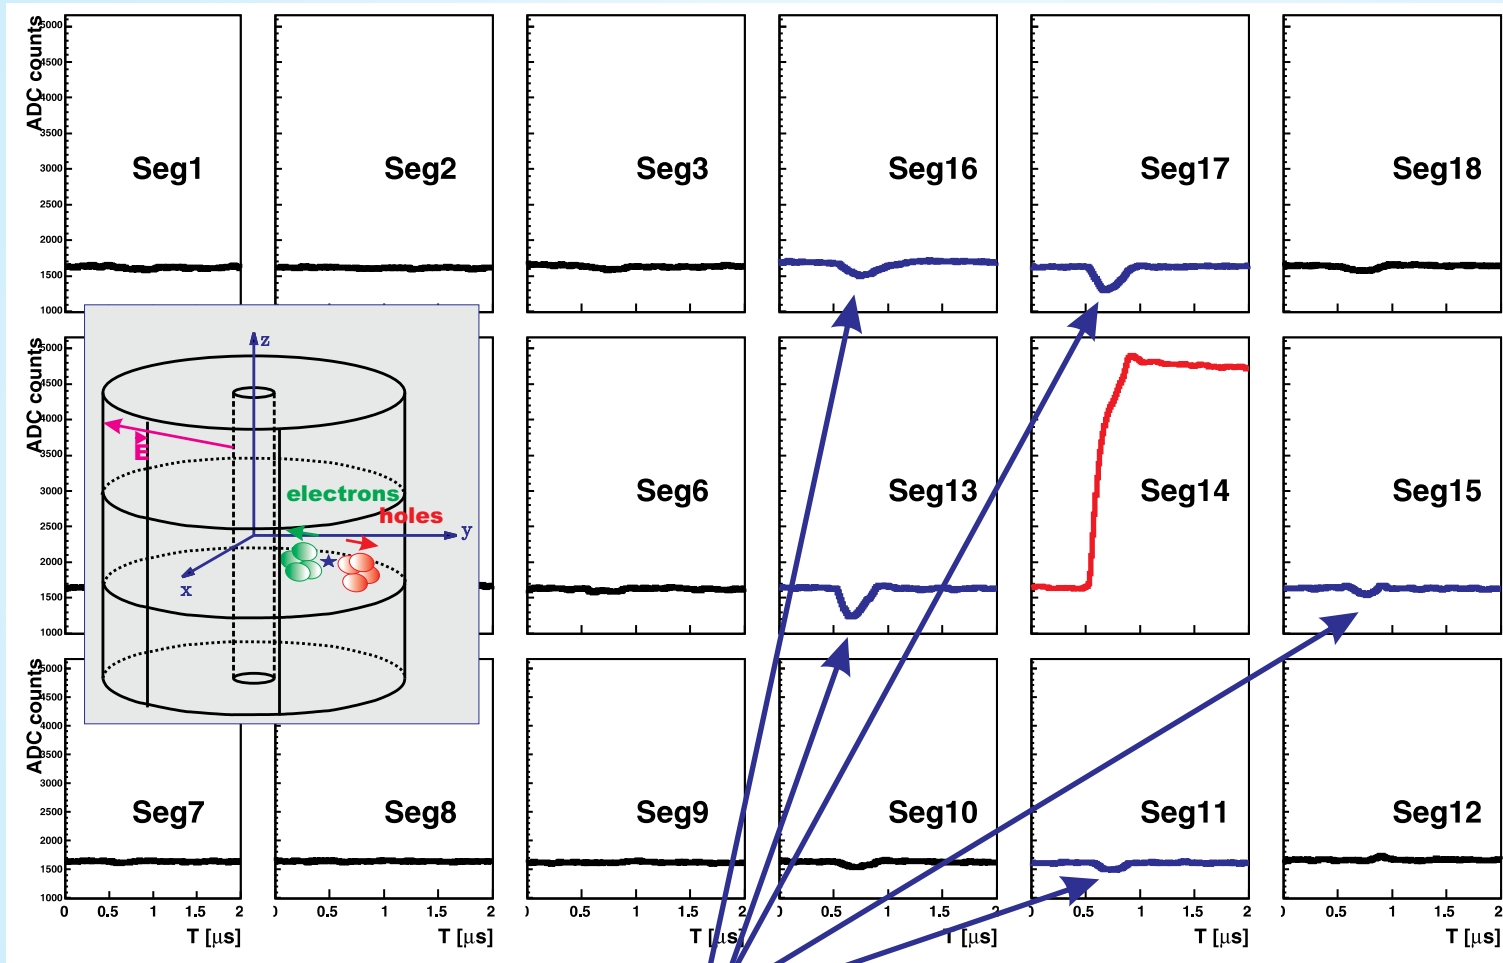

Eur. Phys. J. C 72 (2012) 1950

Axes determination for segmented true-coaxial HPGe detectors

A Real Event

DEP 85
 ^{208}Tl

**Single
Segment
and
Neighbors**

Position reconstruction

Dark Matter Demands

CoGeNT

Why can we not use these segmented detectors for dark matter ?

Spectrum below 3keV

They have too much capacitance, threshold ≈ 10 keV.

440g point contact detector

We need a detector that is good at 0.2 keV and at 2 000 keV and has substantial mass.

The egg-laying woolly Ge milk-pig

= one size/technology fits all
large volume
threshold of 0.1 keV
perfect separation of multi/single-site
position resolution 1mm
separation of gammas and neutrons
energy resolution 1keV at 1MeV
no contamination: bulk and surface

What we try

no egg
for the
moment.

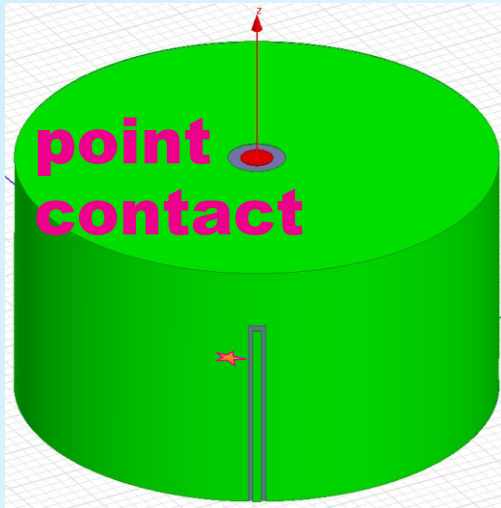

Marry **segmentation** [**position resolution**]
[**event topology**]
with **point contact** [**low threshold**]

We simulated many
options to find out what
is best and what could be built.

Canberra France

Segmented Point Contact Detector

Spatial Information

is available,
but the signals
are too small.

**Multi-site events become
multi-signal events due to
fast rise of signal.**

Detector of the Future

studied a multitude of designs: $z=40\text{mm}$ $r=75\text{mm}$

Phi dependence of the signals at $r=25\text{mm}$, $z=20\text{mm}$

**Chose detector with best grip on topology.
Did R&D with manufacturer. Order early 2013.**

GALATEA

This is where we want to test detectors, but....

**we had a
Poltergeist**

GALATEA

Optical crystal

**cage
against**

Upgrade ready

**to calibrate
temperatures
and test
electronics**

Reference Detector

Xtra: test collimators and MC/analysis software

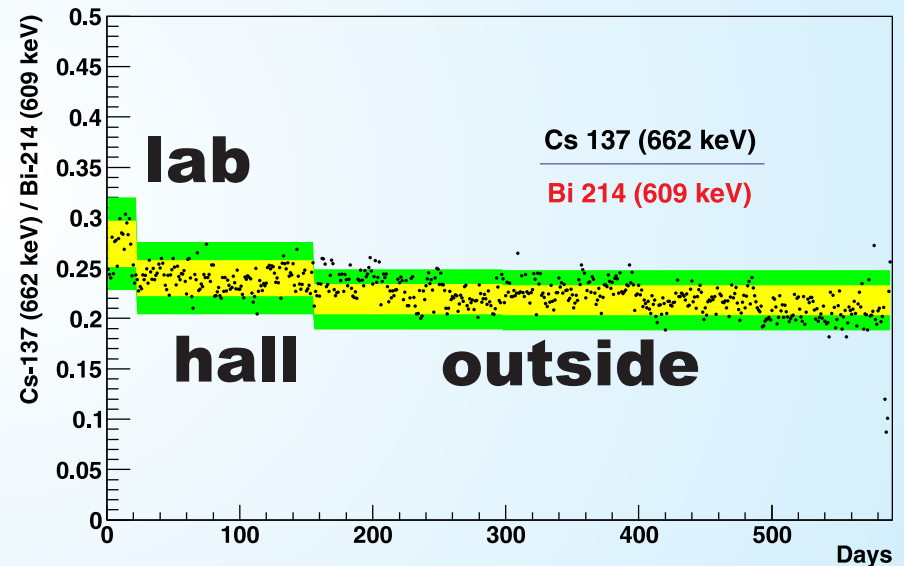

Monitor Environmental Radiation

Monitor Environmental Radiation

**Fukushima:
too little and/or too late**

**We are ready for the
next event.**

A collapse of the earth magnetic field would be nice.

[In]Famous Last Words

Germanium detectors might give us the chance to address some very fundamental questions.

.....

We need new detector technologies to get to the next level.

We need large infrastructure and we need to understand the requirements.

We work on R&D to evaluate the chances and problems
