Introduction to the Standard Model

IMPRS Elementary Particle Physics

MPP, October 28 - 31, 2013

W. Hollik

Max-Planck-Institut für Physik, München

Outline

1. Elements of Quantum Field Theory
2. Gauge Theories
3. QCD
4. Higgs mechanism
5. Electroweak interaction and Standard Model
6. Phenomenology of W and Z bosons, precision tests
7. Higgs bosons

Notations and Conventions

$$\mu, \nu, .. = 0, 1, 2, 3; \qquad k, l, .. = 1, 2, 3$$

$$x = (x^\mu) = (x^0, \vec{x}), \quad x^0 = t \qquad (\hbar = c = 1)$$

$$p = (p^\mu) = (p^0, \vec{p}), \quad p^0 = E = \sqrt{\vec{p}^2 + m^2}$$

$$a_\mu = g_{\mu\nu}\, a^\nu, \qquad (g_{\mu\nu}) = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & -1 \end{pmatrix}$$

$$a^2 = a_\mu a^\mu, \quad a \cdot b = a_\mu b^\mu = a^0 b^0 - \vec{a} \cdot \vec{b}$$

$$\partial_\mu = \frac{\partial}{\partial x^\mu} = g_{\mu\nu}\, \partial^\nu, \quad \partial^\nu = \frac{\partial}{\partial x_\nu} \qquad [\, \partial^0 = \partial_0, \;\; \partial^k = -\partial_k \,]$$

$$\Box = \partial_\mu \partial^\mu = \frac{\partial^2}{\partial t^2} - \Delta$$

2. Gauge theories

Constructing QED – main steps

- start with $\mathcal{L}_0 = \overline{\psi}\,(i\gamma^\mu\partial_\mu - m)\,\psi$ for free fermion field ψ

  symmetric under global gauge transformations

  $\psi' = e^{i\alpha}\psi,\ \alpha \text{ real}$

- perform minimal substitution $\partial_\mu \;\rightarrow\; D_\mu = \partial_\mu - ieA_\mu$

  $\Rightarrow$ invariance under local gauge transformations

  $$\psi' = e^{i\alpha(x)}\,\psi, \quad A'_\mu = A_\mu + \tfrac{1}{e}\,\partial_\mu\alpha(x)$$

  - involves additional vector field A_μ
  - induces interaction between A_μ and ψ

  $$e\,(\overline{\psi}\gamma^\mu\psi)\,A_\mu \;\equiv\; e\,j^\mu A_\mu$$

- make A_μ a dynamical field by adding

  $$\mathcal{L}_A = -\tfrac{1}{4}\,F_{\mu\nu}\,F^{\mu\nu}, \quad F_{\mu\nu} = \partial_\mu A_\nu - \partial_\nu A_\mu$$

Non-Abelian gauge theories

Generalization: “phase” transformations that do not commute

$$\psi \to \psi' = U\psi \quad \textit{with} \quad U_1 U_2 \neq U_2 U_1$$

requires matrices, *i.e.* ψ is a multiplet

$$\psi = \begin{pmatrix} \psi_1 \\ \psi_2 \\ \vdots \\ \psi_n \end{pmatrix}, \qquad U = n \times n \text{ -}\textit{matrix}$$

each $\psi_k = \psi_k(x)$ is a Dirac spinor

(i) global symmetry

starting point: $\mathcal{L}_0 = \overline{\psi}\,(i\gamma^\mu\,\partial_\mu - m)\,\psi$

where $\overline{\psi} = (\overline{\psi}_1, \cdots, \overline{\psi}_n)$

consider unitary matrices: $U^\dagger = U^{-1}$

$$\psi' = U\psi \quad \Rightarrow \quad \overline{\psi'} = \overline{\psi}\,U^\dagger = \overline{\psi}\,U^{-1}$$

$$\Rightarrow \quad \overline{\psi'}\psi' = \overline{\psi}\psi, \quad \overline{\psi'}\gamma^\mu\partial_\mu\psi' = \overline{\psi}\gamma^\mu\partial_\mu\psi$$

if U does not depend on x

$\Rightarrow$ $\mathcal{L}_0$ is invariant under $\psi \to U\psi$

U: global gauge transformation

similar for **scalar fields:**

$$\phi \to \phi' = U\phi, \qquad \phi = \begin{pmatrix} \phi_1 \\ \phi_2 \\ \vdots \\ \phi_n \end{pmatrix}$$

each $\psi_k = \phi_k(x)$ is a scalar field, $\phi^\dagger = (\phi_1^\dagger, \cdots, \phi_n^\dagger)$

terms $\phi^\dagger\phi$, $(\partial_\mu\phi)^\dagger(\partial^\mu\phi)$ are invariant

$\Rightarrow$ $\mathcal{L}_0 = (\partial_\mu\phi)^\dagger(\partial^\mu\phi) - m^2\,\phi^\dagger\phi$ is invariant relevant in physics:

the special unitary $n \times n$-matrices with det=1

group $SU(n)$

examples:

$$SU(2): \quad \psi = \begin{pmatrix} \psi_1 \\ \psi_2 \end{pmatrix} \quad e.g. \quad \psi = \begin{pmatrix} \psi_\nu \\ \psi_e \end{pmatrix}$$ *isospin*

$$SU(3): \quad \psi = \begin{pmatrix} \psi_1 \\ \psi_2 \\ \psi_3 \end{pmatrix} \quad e.g. \quad \psi = \begin{pmatrix} \psi_r \\ \psi_g \\ \psi_b \end{pmatrix}$$ *colour*

$SU(n)$ matrices U can be written as exponentials

$$U(\theta_1, \cdots, \theta_N) = e^{i\theta_a T_a} \quad \textit{sum over } a = 1, \cdots N$$

$\theta_1, \cdots \theta_N$: real parameters

$T_1, \cdots T_N$: $n \times n$-matrices, generators, $T_a^\dagger = T_a$

infinitesimal θ : $U = \mathbf{1} + i\theta_a T_a \quad (+O(\theta^2))$

N-dimensional Lie Group

det=1 and unitarity $\Rightarrow$ $N = n^2 - 1$

$n = 2: \quad N = 3, \qquad n = 3: \quad N = 8$

commutators $[T_a, T_b] \neq 0$ non-Abelian

$$\boxed{[T_a, T_b] = i f_{abc} T_c}$$

Lie Algebra

f_{abc} : real numbers, structure constants

$f_{abc} = -f_{bac} = \cdots$ antisymmetric

commutators $[T_a, T_b] \neq 0$ non-Abelian

$$\boxed{[T_a, T_b] = i\, f_{abc}\, T_c}$$

Lie Algebra

f_{abc} : real numbers, structure constants

$f_{abc} = -f_{bac} = \cdots$ antisymmetric

$\boxed{SU(2)}$ $f_{abc} = \epsilon_{abc}$ *(like angular momentum)*

$T_a = \frac{1}{2}\sigma_a,$ σ_a : *Pauli matrices (a=1,2,3)*

commutators $[T_a, T_b] \neq 0$ non-Abelian

$$\boxed{[T_a, T_b] = f_{abc}\, T_c}$$

Lie Algebra

f_{abc} : real numbers, structure constants

$f_{abc} = -f_{bac} = \cdots$ antisymmetric

$\boxed{SU(2)}$ $f_{abc} = \epsilon_{abc}$ *(like angular momentum)*

$T_a = \frac{1}{2}\,\sigma_a,$ σ_a : *Pauli matrices (a=1,2,3)*

$\boxed{SU(3)}$ $T_a = \frac{1}{2}\,\lambda_a,$ λ_a : *Gell-Mann matrices (a=1,...8)*

$$\lambda_1 = \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \quad \cdots$$

$$\lambda_1 = \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \quad \lambda_2 = \begin{pmatrix} 0 & -i & 0 \\ i & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \quad \lambda_3 = \begin{pmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 0 \end{pmatrix},$$

$$\lambda_4 = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 0 & 0 \\ 1 & 0 & 0 \end{pmatrix}, \quad \lambda_5 = \begin{pmatrix} 0 & 0 & -i \\ 0 & 0 & 0 \\ i & 0 & 0 \end{pmatrix},$$

$$\lambda_6 = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{pmatrix}, \lambda_7 = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & -i \\ 0 & i & 0 \end{pmatrix}, \lambda_8 = \frac{1}{\sqrt{3}} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & -2 \end{pmatrix}$$

(ii) local symmetry

now: $\theta_a = \theta_a(x)$ for $a = 1, \ldots N$

covariant derivative $\partial_\mu \to D_\mu \, = \, \partial_\mu - ig\, \mathbf{W}_\mu$

vector field $\mathbf{W}_\mu$ is $n \times n$ matrix: $\mathbf{W}_\mu(x) = T_a\, W_\mu^a(x)$

induces interaction term $\mathcal{L}_0 \to \mathcal{L}_0 + \mathcal{L}_{\rm int}$

with $\mathcal{L}_{\rm int} = g\, \overline{\Psi}\gamma^\mu \mathbf{W}_\mu \Psi \; = g\, (\overline{\Psi}\gamma^\mu T_a \Psi)\, W_\mu^a \, \equiv \, j_a^\mu\, W_\mu^a$

For a multiplet of scalar fields Φ:

$$\mathcal{L}_0 = (\partial_\mu \Phi)^\dagger (\partial^\mu \Phi) \quad \to \quad \mathcal{L} = (D_\mu \Phi)^\dagger (D^\mu \Phi)$$

$\mathcal{L}$ is invariant under local gauge transformations

$$\Psi \to \Psi' = U\,\Psi\,,$$

$$\mathbf{W}_\mu \to \mathbf{W}'_\mu = U\,\mathbf{W}_\mu\,U^{-1} - \frac{i}{g}(\partial_\mu U)U^{-1}$$

for infinitesimal transformations:

$$W^a_\mu \to {W'}^a_\mu = W^a_\mu + \frac{1}{g}\,\partial_\mu\theta^a + f_{abc}\,W^b_\mu\,\theta^c$$

crucial property of covariant derivative

$$\boxed{D'_\mu U = U\,D_\mu}$$

(iii) dynamics of W^a_μ fields

need: additional term $\mathcal{L}_W$ $\Rightarrow$ e.o.m., propagators

naive: $\sum_a (\partial_\mu W^a_\nu - \partial_\nu W^a_\mu)^2$ *not gauge invariant*

instead: $\mathbf{F}_{\mu\nu} = D_\mu \mathbf{W}_\nu - D_\nu \mathbf{W}_\mu \equiv F^a_{\mu\nu} T_a$

$$= \partial_\mu \mathbf{W}^a_\nu - \partial_\nu \mathbf{W}^a_\mu - ig\,[\mathbf{W}_\mu, \mathbf{W}_\nu]$$

$$= \frac{i}{g}\,[D_\mu, D_\nu]$$

gauge transformation: $\mathbf{W}_\mu \to \mathbf{W}'_\mu, \quad D_\mu \to D'_\mu$

$$\Rightarrow \quad \mathbf{F}_{\mu\nu} \to \mathbf{F}'_{\mu\nu} = U\,\mathbf{F}_{\mu\nu}\,U^{-1}$$

$$\Rightarrow \mathrm{Tr}\,(\mathbf{F}'_{\mu\nu}\mathbf{F}'^{\mu\nu}) = \mathrm{Tr}\,(U\mathbf{F}_{\mu\nu}U^{-1}\,U\mathbf{F}^{\mu\nu}U^{-1}) = \mathrm{Tr}\,(\mathbf{F}_{\mu\nu}\mathbf{F}^{\mu\nu})$$

gauge invariant

Lagrangian:

$$\mathcal{L}_W = -\frac{1}{2}\,\mathrm{Tr}\,(\mathbf{F}_{\mu\nu}\mathbf{F}^{\mu\nu}) = -\frac{1}{4}\,\sum_a F^a_{\mu\nu}F^{a,\mu\nu}$$

components of $\mathbf{F}_{\mu\nu}$ *[using normalization* $\mathrm{Tr}(T_a T_b) = \frac{1}{2}\,\delta_{ab}$ *]*

$$F^a_{\mu\nu} = \partial_\mu W^a_\nu - \partial_\nu W^a_\mu + g\,f_{abc}\,W^b_\mu\,W^c_\nu$$

$F^a_{\mu\nu}$ = *Abelian* + *non-Abelian*

$$\mathcal{L}_W = \underbrace{\text{quadratic}}_{\text{free part}} + \underbrace{\text{cubic} + \text{quartic}}_{\text{tri- and quadri-linear interactions}}$$

$$
\begin{aligned}
\mathcal{L}_W &= -\frac{1}{4}\,(\partial_\mu W_\nu^a - \partial_\nu W_\mu^a)^2 \qquad \Rightarrow \ \text{propagator} \\
&= -\frac{1}{2}\,g f_{abc}\,(\partial_\mu W_\nu^a - \partial_\nu W_\mu^a)\,W^{b,\mu}\,W^{c,\nu} \\
&= -\frac{1}{4}\,g^2 f_{abc}\,f_{ade}\,W_\mu^b\,W_\nu^c\,W^{d,\mu}\,W^{e,\nu}
\end{aligned}
$$

new type of couplings:

- self-couplings of vector fields (gauge couplings)
- universal coupling constant g for fermions and vector fields

3. Quantum Chromodynamics (QCD)

each quark field $q = u, d, \ldots$ appears in 3 colours

$$\psi = \begin{pmatrix} q \\ q \\ q \end{pmatrix}, \quad \overline{\psi} = (\overline{q}, \overline{q}, \overline{q})$$

$T_a = \frac{1}{2}\lambda_a \quad (a = 1, \ldots 8)$ *generators, group SU(3)*

$W_\mu^a \equiv G_\mu^a$ *8 gluon fields*

$G_{\mu\nu}^a = \partial_\mu G_\nu^a - \partial_\nu G_\mu^a + g_s f_{abc} G_\mu^b G_\nu^c$ *field strength*

$D_\mu = \partial_\mu - i g_s T_a G_\mu^a$ *covariant derivative*

g_s *coupling constant of strong interaction,* $\alpha_s = \frac{g_s^2}{4\pi}$

QCD Lagrangian

(for one flavor of quarks)

$$\mathcal{L}_{\mathrm{QCD}} = \mathcal{L}_{\mathrm{F}} + \mathcal{L}_{\mathrm{G}}, \qquad \mathcal{L}_{\mathrm{F}} = \overline{\psi}\,(i\gamma^{\mu} D_{\mu} - m)\,\psi\,,$$

$$\begin{aligned}
\mathcal{L}_{\mathrm{QCD}} &= \overline{\psi}\,(i\gamma^{\mu}\partial_{\mu} - m)\,\psi \\
&+ g_s\,\overline{\psi}\,\gamma^{\mu}\frac{\lambda_a}{2}\,\psi\,G^a_{\mu} \\
&- \frac{1}{4}\,G^a_{\mu\nu}G^{a,\,\mu\nu} - \frac{1}{2\xi}\,(\partial_{\mu}G^{a,\,\mu})^2
\end{aligned}$$

QCD Lagrangian

(for one flavor of quarks)

$$\mathcal{L}_{\rm QCD} = \mathcal{L}_{\rm F} + \mathcal{L}_{\rm G} =$$

$$\overline{\psi}\,(i\gamma^{\mu}\partial_{\mu} - m)\,\psi$$

$$+ \quad g_s\,\overline{\psi}\,\gamma^{\mu}\frac{\lambda_a}{2}\,\psi\,G^a_{\mu}$$

$$- \quad \frac{1}{4}\,G^a_{\mu\nu}G^{a,\,\mu\nu} - \frac{1}{2\xi}\,(\partial_{\mu}G^{a,\,\mu})^2$$

reality: *sum over quark flavors f, with* $\psi \to \psi_f,\ m \to m_f$

- Quark-Gluon-Vertex: 
$ig_S(T_a)_{kl}\gamma^\mu$

- Quark-Propagator:  $i\frac{\not{q}+m}{q^2-m^2+i\epsilon} \equiv \frac{i}{\not{q}-m+i\epsilon}$

- Gluon-Propagator:  $\frac{-ig_{\mu\nu}}{q^2+i\epsilon}$

- Triple-Gluon-Vertex: 
- Quartic-Gluon-Vertex: 
4. Higgs mechanism

problem: weak interaction, gauge bosons are massive

mass terms $\sim M^2 W^a_\mu W^{a,\mu}$ spoil local gauge invariance

- bad high energy behaviour of amplitudes and cross sections, conflict with unitarity
  reason: longitudinal polarization $\epsilon^\mu \simeq \frac{k^\mu}{M} \sim k^\mu$
- bad divergence of higher orders with loop diagrams
  reason: propagators contain $-g_{\mu\nu} + \frac{k_\mu k_\nu}{M^2}$
  $\Rightarrow$ additional powers of momenta in loop integration
  $\Rightarrow$ spoil renormalizability

renormalizable theories: divergences can be removed by a finite number of counter terms

gauge invariant theories: counter terms for parameters (and fields)

W and Z are massive

- W, Z have longitudinal polarization states

  polarization vectors of W (Z) $\epsilon_{\rm L} \sim k/M_{\rm W}$

  for large momentum k

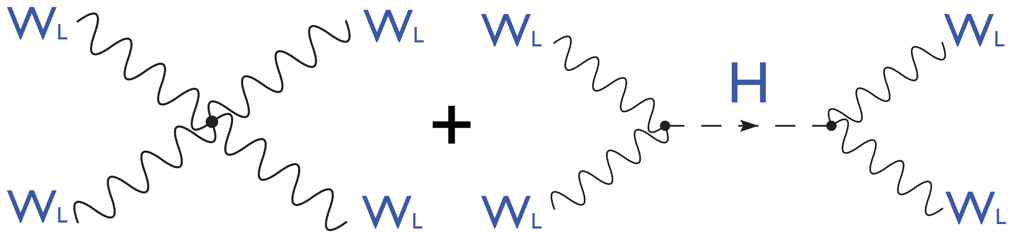
- 
  bad high energy behaviour of WW scattering

- 
  bad divergence of loop integrals

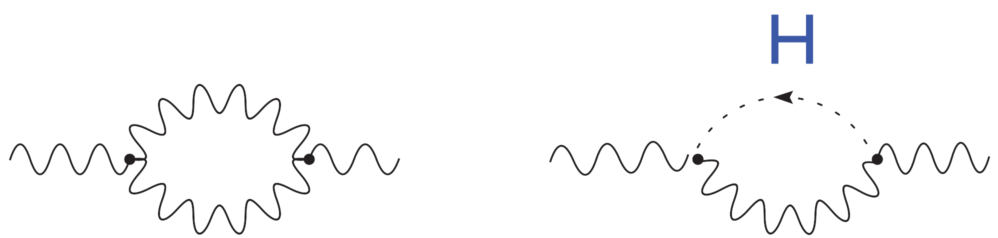
way out:

new scalar with appropriate couplings to W,Z

- restoration of unitarity



- restoration UV finiteness $\Rightarrow$ renormalizability

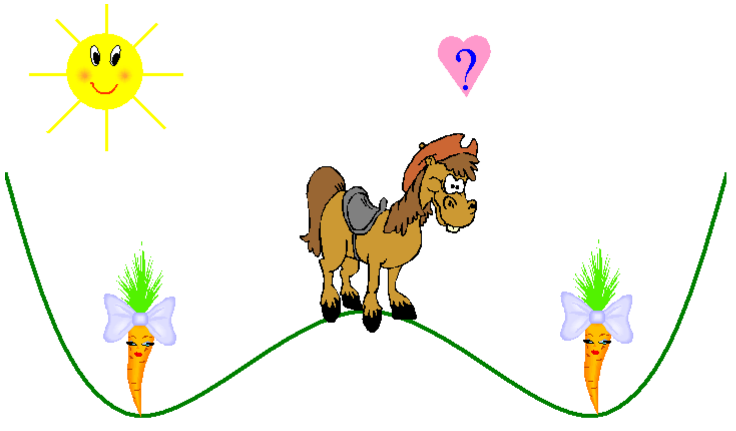


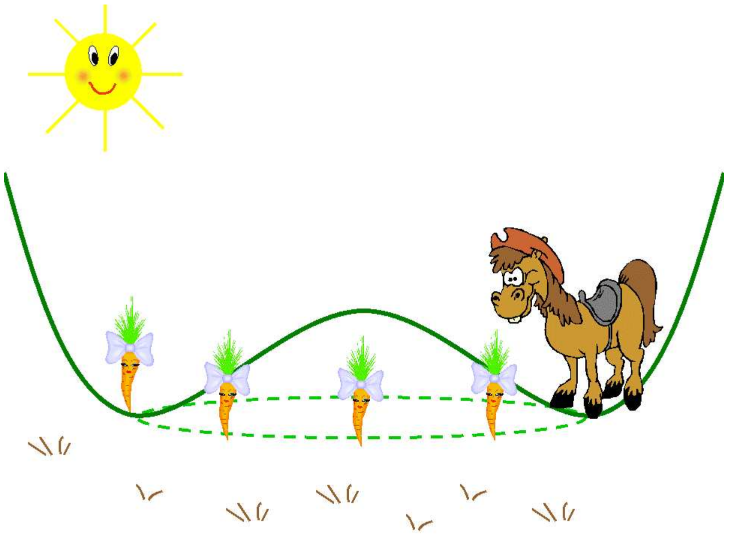
consistent way: Higgs mechanism
= scalar with gauge invariant interactions
and non-invariant ground state

Spontaneous symmetry breaking (SSB)

physical system: has a symmetry

ground state: not symmetric



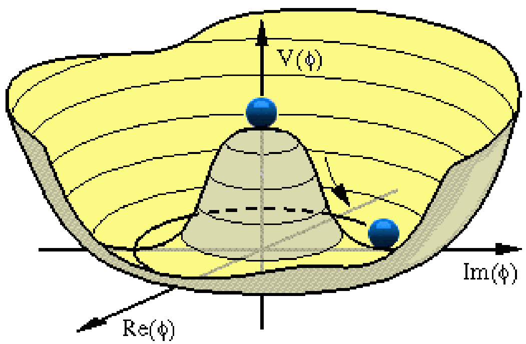


[A. Pich]

example: complex scalar field $\phi \neq \phi^\dagger$

Lagrangian with interaction V (potential), minimum at $\phi_0 = v$

$$\mathcal{L} = |\partial_\mu \phi|^2 - V(\phi)$$



$V = V(|\phi|)$: *$\mathcal{L}$ symmetric under* $\phi \to e^{i\alpha}\phi$, $U(1)$

$v \neq 0$: $\phi_0' = e^{i\alpha} v \neq \phi_0$ *not symmetric*

$V = V(|\phi_0'|) = V(|\phi_0|)$: *vacuum is degenerate* write $\phi(x) = \eta(x) e^{i\theta(x)}$, η and θ real

$V(|\phi|) = V(\eta)$, minimum at $\eta = v$: $V'(v) = 0$, $V''(v) > 0$

expand around minimum: $\eta(x) = v + \frac{1}{\sqrt{2}} H(x)$

$$V(\eta) = V(v) + \tfrac{1}{2} V''(v) \cdot \tfrac{1}{2} H^2 + \cdots$$

$$\mathcal{L} = \tfrac{1}{2} |\partial_\mu H|^2 - \underbrace{\frac{1}{2} V''(v)}_{m_H^2 > 0} \cdot \tfrac{1}{2} H^2 + v^2 |\partial_\mu \theta|^2 + \cdots$$

$m_H^2 > 0$ *mass of H*

- H field is massive
- θ field is massless, no θ^2 term: Goldstone field
- special case of Goldstone theorem:

  for each broken generator T_a with $T_a \phi_0 \neq 0$
  there is a massless Goldstone field $\theta(x)$

SSB in gauge theories

$$\mathcal{L} = \left(D_\mu \phi\right)^+ \left(D^\mu \phi\right) - V(|\phi|) - \frac{1}{4} F_{\mu\nu} F^{\mu\nu}, \quad D_\mu = \partial_\mu - ieA_\mu$$

invariant under local U(1) transformations:

$$\phi'(x) = e^{i\alpha(x)}\, \phi(x) = e^{i\alpha(x)}\, e^{i\theta(x)} \eta(x)$$

$$A'_\mu(x) = A_\mu(x) + \frac{1}{e} \partial_\mu \alpha(x)$$

choose $\alpha(x) = -\theta(x)$: $\quad \phi'(x) = \eta(x)$

$$\mathcal{L} = |(\partial_\mu - ieA'_\mu)\eta|^2 - V(\eta) - \frac{1}{4} F'_{\mu\nu} F'^{\,\mu\nu}$$

massless θ field removed (unphysical)

$$\mathcal{L} = |(\partial_\mu - ieA'_\mu)(v + \tfrac{1}{\sqrt{2}}H)|^2 - \tfrac{1}{4}F'_{\mu\nu}F'^{\mu\nu} - V$$

$$= \underbrace{-\frac{1}{4}F'_{\mu\nu}F'^{\mu\nu} + v^2 e^2 A'_\mu A'^\mu}_{\text{massive A-field, } m_A \sim ev} + \underbrace{\frac{1}{2}[(\partial_\mu H)^2 - m_H^2 H^2]}_{\text{neutral scalar, } m_H \neq 0} + \cdots$$

in this special gauge: no Goldstone field **unitary gauge**

A_μ-field propagator: $$\frac{i}{k^2 - m_A^2 + i\varepsilon} \underbrace{\left(-g_{\mu\nu} + \frac{k_\mu k_\nu}{m_A^2}\right)}_{\text{polarization sum of 3 pol. states}}$$

massive vector field without spoiling gauge symmetry of $\mathcal{L}$

two different gauges

properties	ϕ field	A_μ field
symmetry manifest	H, θ	2 polarizations (transverse)
physics manifest	H	3 polarizations (2 transverse + 1 longitudinal)

$\theta \quad \rightarrow \quad$ *longitudinal polarization of* A_μ

5. Electroweak Standard Model

preliminaries

<u>Dirac matrices:</u> $\gamma^\mu \; (\mu = 0, 1, 2, 3), \quad \gamma^\mu\gamma^\nu + \gamma^\nu\gamma^\mu = 2\, g^{\mu\nu}$

$\overline{\Gamma} = \gamma^0 (\Gamma)^\dagger \, \gamma^0, \quad \Gamma$ *any Dirac matrix oder product of matrices*

further Dirac matrix: $\gamma_5 = i\, \gamma^0\gamma^1\gamma^2\gamma^3 = \begin{pmatrix} 0 & \mathbf{1} \\ \mathbf{1} & 0 \end{pmatrix}$

$\gamma_5\gamma^\mu + \gamma^\mu\gamma_5 = 0, \qquad \overline{\gamma_5} = -\gamma_5, \qquad \gamma_5^2 = \mathbf{1}$

<u>chiral fermions:</u>

$\psi^L = \frac{1-\gamma_5}{2}\,\psi$ *left-handed spinor, L-chiral spinor*

$\psi^R = \frac{1+\gamma_5}{2}\,\psi$ *right-handed spinor, R-chiral spinor*

projectors on right/left chirality: $\omega_\pm = \frac{1\pm\gamma_5}{2}, \quad (\omega_\pm)^2 = \omega_\pm$

chiral currents:

$$\overline{\psi^L}\,\gamma^\mu\psi^L = \overline{\psi}\,\gamma^\mu\,\tfrac{1-\gamma_5}{2}\,\psi \equiv J_L^\mu$$ left-handed current

$$\overline{\psi^R}\,\gamma^\mu\psi^R = \overline{\psi}\,\gamma^\mu\,\tfrac{1+\gamma_5}{2}\,\psi \equiv J_R^\mu$$ right-handed current

$$J_V^\mu = \overline{\psi}\gamma^\mu\psi = J_L^\mu + J_R^\mu$$ vector current

$$J_A^\mu = \overline{\psi}\gamma^\mu\gamma_5\psi = -J_L^\mu + J_R^\mu$$ axialvector current

mass term:

$$m\,\overline{\psi}\psi = m\,(\overline{\psi^L}\,\psi^R + \overline{\psi^R}\,\psi^L)$$

connects L and R !

symmetry group: $SU(2)_I \times U(1)_Y$

$SU(2)_I$: weak isospin, generators $T_{\rm I}^a = \frac{1}{2}\,\sigma_a$ *for* L, $= 0$ *for* R

$U(1)_Y$: weak hypercharge, generator Y

$$T_{\rm I}^3 + Y/2 = Q$$

fermion content (ignoring possibe right-handed neutrinos)

					$T_{\rm I}^3$	Y
leptons:	$\Psi_L^{\rm L} =$	$\begin{pmatrix} \nu_e^{\rm L} \\ e^{\rm L} \end{pmatrix}$	$\begin{pmatrix} \nu_\mu^{\rm L} \\ \mu^{\rm L} \end{pmatrix}$	$\begin{pmatrix} \nu_\tau^{\rm L} \\ \tau^{\rm L} \end{pmatrix}$	$+\frac{1}{2}$, $-\frac{1}{2}$	-1, -1
	$\psi_l^{\rm R} =$	$e^{\rm R}$	$\mu^{\rm R}$	$\tau^{\rm R}$	0	-2
quarks:	$\Psi_Q^{\rm L} =$	$\begin{pmatrix} u^{\rm L} \\ d^{\rm L} \end{pmatrix}$	$\begin{pmatrix} c^{\rm L} \\ s^{\rm L} \end{pmatrix}$	$\begin{pmatrix} t^{\rm L} \\ b^{\rm L} \end{pmatrix}$	$+\frac{1}{2}$, $-\frac{1}{2}$	$+\frac{1}{3}$, $+\frac{1}{3}$
	$\psi_u^{\rm R} =$	$u^{\rm R}$	$c^{\rm R}$	$t^{\rm R}$	0	$+\frac{4}{3}$
	$\psi_d^{\rm R} =$	$d^{\rm R}$	$s^{\rm R}$	$b^{\rm R}$	0	$-\frac{2}{3}$

gauge boson content

$SU(2)_I$: generators $T_{\rm I}^1,\ T_{\rm I}^2,\ T_{\rm I}^3$

gauge fields $W_\mu^1,\ W_\mu^2,\ W_\mu^3$

also: $W_\mu^\pm = \frac{1}{\sqrt{2}}\left(W_\mu^1 \mp i\, W_\mu^2\right),\ W_\mu^3$

$U(1)_Y$: generator Y

gauge field B_μ

$$[T_{\rm I}^a,\ T_{\rm I}^b] = i\epsilon_{abc}\, T_{\rm I}^c\,, \quad [T_{\rm I}^a, Y] = 0$$

gauge boson content

$SU(2)_I$:   generators $T^1_{\mathrm{I}},\ T^2_{\mathrm{I}},\ T^3_{\mathrm{I}}$

gauge fields $W^1_\mu,\ W^2_\mu,\ W^3_\mu$

also: $W^\pm_\mu = \frac{1}{\sqrt{2}}\left(W^1_\mu \mp i\, W^2_\mu\right),\ W^3_\mu$

$U(1)_Y$:   generator Y

gauge field B_μ

notation: $\not{\partial} = \gamma^\mu \partial_\mu, \quad \not{a} = \gamma^\mu a_\mu$

Free Lagrangian of (still massless) fermions:

$$\mathcal{L}_{0,\mathrm{ferm}} = \mathrm{i}\overline{\psi_f}\not{\partial}\psi_f = \mathrm{i}\overline{\Psi^{\mathrm{L}}_L}\not{\partial}\Psi^{\mathrm{L}}_L + \mathrm{i}\overline{\Psi^{\mathrm{L}}_Q}\not{\partial}\Psi^{\mathrm{L}}_Q + \mathrm{i}\overline{\psi^{\mathrm{R}}_l}\not{\partial}\psi^{\mathrm{R}}_l + \mathrm{i}\overline{\psi^{\mathrm{R}}_u}\not{\partial}\psi^{\mathrm{R}}_u + \mathrm{i}\overline{\psi^{\mathrm{R}}_d}\not{\partial}\psi^{\mathrm{R}}_d$$

Minimal substitution:

$$\partial_\mu \to D_\mu = \partial_\mu - \mathrm{i}g_2 T^a_{\mathrm{I}} W^a_\mu + \mathrm{i}g_1 \tfrac{1}{2} Y B_\mu = D^{\mathrm{L}}_\mu \omega_- + D^{\mathrm{R}}_\mu \omega_+,$$

$$D^{\mathrm{L}}_\mu = \partial_\mu - \frac{\mathrm{i}g_2}{\sqrt{2}} \begin{pmatrix} 0 & W^+_\mu \\ W^-_\mu & 0 \end{pmatrix} - \frac{\mathrm{i}}{2} \begin{pmatrix} g_2 W^3_\mu - g_1 Y^{\mathrm{L}} B_\mu & 0 \\ 0 & -g_2 W^3_\mu - g_1 Y^{\mathrm{L}} B_\mu \end{pmatrix},$$

$$D^{\mathrm{R}}_\mu = \partial_\mu + \mathrm{i}g_1 \tfrac{1}{2} Y^{\mathrm{R}} B_\mu$$

Photon identification:

“ rotation”:

$$\begin{pmatrix} Z_\mu \\ A_\mu \end{pmatrix} = \begin{pmatrix} c_{\mathrm{W}} & s_{\mathrm{W}} \\ -s_{\mathrm{W}} & c_{\mathrm{W}} \end{pmatrix} \begin{pmatrix} W^3_\mu \\ B_\mu \end{pmatrix},$$

$c_{\mathrm{W}} = \cos\theta_{\mathrm{W}}$, $s_{\mathrm{W}} = \sin\theta_{\mathrm{W}}$,
θ_{W} = mixing angle

$$D^{\mathrm{L}}_\mu\Big|_{A_\mu} = -\frac{\mathrm{i}}{2} A_\mu \begin{pmatrix} -g_2 s_{\mathrm{W}} - g_1 c_{\mathrm{W}} Y^{\mathrm{L}} & 0 \\ 0 & g_2 s_{\mathrm{W}} - g_1 c_{\mathrm{W}} Y^{\mathrm{L}} \end{pmatrix} \stackrel{!}{=} \mathrm{i}e A_\mu \begin{pmatrix} Q_1 & 0 \\ 0 & Q_2 \end{pmatrix}$$

- charged difference in doublet $Q_1 - Q_2 = 1$ $\quad\to\quad$ $g_2 = \dfrac{e}{s_{\mathrm{W}}}$
- normalize $Y^{\mathrm{L/R}}$ such that $\quad g_1 = \dfrac{e}{c_{\mathrm{W}}}$

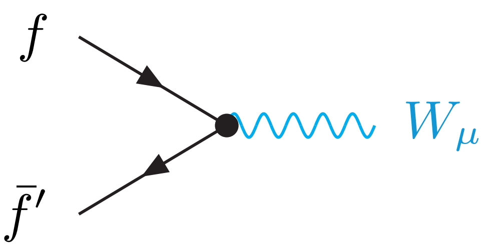
$\hookrightarrow$ Y fixed by “Gell-Mann–Nishijima relation”: $\quad Q = T^3_{\mathrm{I}} + \dfrac{Y}{2}$

Fermion–gauge-boson interaction:

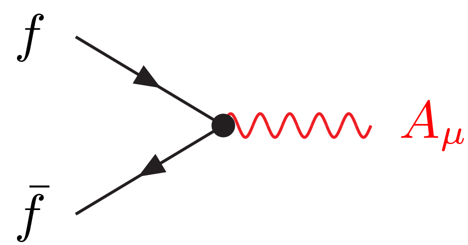
$$\mathcal{L}_{\mathrm{ferm,YM}} = \frac{e}{\sqrt{2}s_{\mathrm{W}}}\overline{\Psi_F^{\mathrm{L}}}\begin{pmatrix} 0 & \not{W}^+ \\ \not{W}^- & 0 \end{pmatrix}\Psi_F^{\mathrm{L}} + \frac{e}{2c_{\mathrm{W}}s_{\mathrm{W}}}\overline{\Psi_F^{\mathrm{L}}}\sigma^3 \not{Z}\Psi_F^{\mathrm{L}}$$

$$- e\frac{s_{\mathrm{W}}}{c_{\mathrm{W}}}Q_f\overline{\psi_f}\not{Z}\psi_f - eQ_f\overline{\psi_f}\not{A}\psi_f \qquad (f\text{=all fermions, } F\text{= all doublets})$$

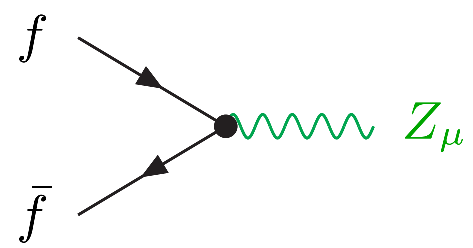
Feynman rules:



$$\frac{\mathrm{i}e}{\sqrt{2}s_{\mathrm{W}}}\gamma_\mu\omega_-$$



$$-\mathrm{i}Q_f e\gamma_\mu$$



$$\mathrm{i}e\gamma_\mu(g_f^+\omega_+ + g_f^-\omega_-) = \mathrm{i}e\gamma_\mu(v_f - a_f\gamma_5)$$

with $g_f^+ = -\frac{s_{\mathrm{W}}}{c_{\mathrm{W}}}Q_f, \quad g_f^- = -\frac{s_{\mathrm{W}}}{c_{\mathrm{W}}}Q_f + \frac{T^3_{\mathrm{I},f}}{c_{\mathrm{W}}s_{\mathrm{W}}},$

$$v_f = -\frac{s_{\mathrm{W}}}{c_{\mathrm{W}}}Q_f + \frac{T^3_{\mathrm{I},f}}{2c_{\mathrm{W}}s_{\mathrm{W}}}, \quad a_f = \frac{T^3_{\mathrm{I},f}}{2c_{\mathrm{W}}s_{\mathrm{W}}}$$

gauge field Lagrangian (Yang-Mills Lagrangian)

$$\mathcal{L}_{\mathrm{YM}} = -\frac{1}{4} W^a_{\mu\nu} W^{a,\mu\nu} - \frac{1}{4} B_{\mu\nu} B^{\mu\nu}$$

Field-strength tensors:

$$W^a_{\mu\nu} = \partial_\mu W^a_\nu - \partial_\nu W^a_\mu + g_2 \epsilon^{abc} W^b_\mu W^c_\nu, \qquad B_{\mu\nu} = \partial_\mu B_\nu - \partial_\nu B_\mu$$

Lagrangian in terms of "physical" fields:

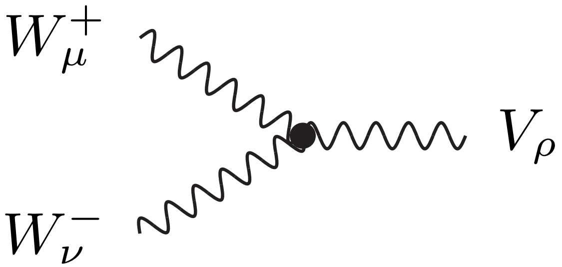
$$\mathcal{L}_{\mathrm{YM}} = -\frac{1}{2}(\partial_\mu W^+_\nu - \partial_\nu W^+_\mu)(\partial^\mu W^{-,\nu} - \partial^\nu W^{-,\mu})$$
$$- \frac{1}{4}(\partial_\mu Z_\nu - \partial_\nu Z_\mu)(\partial^\mu Z^\nu - \partial^\nu Z^\mu) - \frac{1}{4}(\partial_\mu A_\nu - \partial_\nu A_\mu)(\partial^\mu A^\nu - \partial^\nu A^\mu)$$

$+$ (trilinear interaction terms involving AW^+W^-, ZW^+W^-)

$+$ (quadrilinear interaction terms involving AAW^+W^-, AZW^+W^-, ZZW^+W^-, $W^+W^-W^+W^-$)

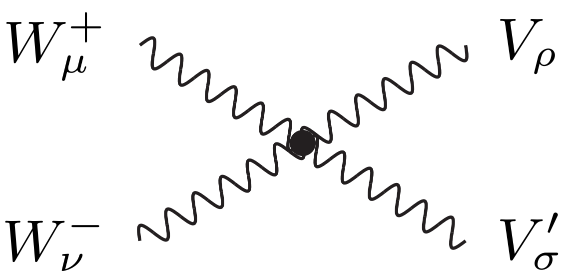
Feynman rules for gauge-boson self-interactions:

(fields and momenta incoming)



$$\mathrm{i}eC_{WWV}\Big[g_{\mu\nu}(k_+ - k_-)_\rho + g_{\nu\rho}(k_- - k_V)_\mu + g_{\rho\mu}(k_V - k_+)_\nu\Big]$$

with $C_{WW\gamma} = 1, \quad C_{WWZ} = -\frac{c_\mathrm{W}}{s_\mathrm{W}}$



$$\mathrm{i}e^2C_{WWVV'}\Big[2g_{\mu\nu}g_{\rho\sigma} - g_{\mu\rho}g_{\sigma\nu} - g_{\mu\sigma}g_{\nu\rho}\Big]$$

with $C_{WW\gamma\gamma} = -1, \qquad C_{WW\gamma Z} = \frac{c_\mathrm{W}}{s_\mathrm{W}},$

$$C_{WWZZ} = -\frac{c_\mathrm{W}^2}{s_\mathrm{W}^2}, \quad C_{WWWW} = \frac{1}{s_\mathrm{W}^2}$$

Higgs mechanism ⇒ masses of W and Z bosons

spontaneous breaking $SU(2)_I \times U(1)_Y \to U(1)_Q$
unbroken em. gauge symmetry, massless photon

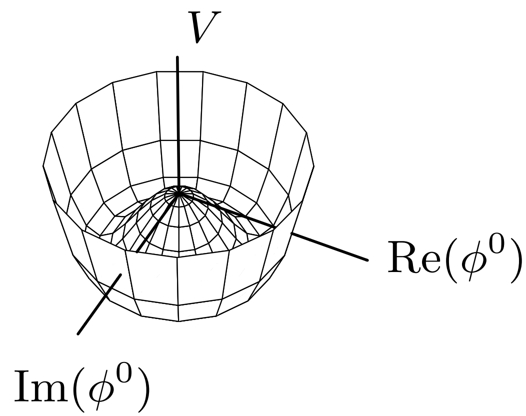
Minimal scalar sector with complex scalar doublet $\Phi = \begin{pmatrix} \phi^+ \\ \phi^0 \end{pmatrix}$, $Y_\Phi = 1$

Scalar self-interaction via Higgs potential:

$$V(\Phi) = -\mu^2 \Phi^\dagger \Phi + \frac{\lambda}{4}(\Phi^\dagger \Phi)^2, \quad \mu^2, \lambda > 0,$$

$= \mathrm{SU(2)_I \times U(1)_Y}$ symmetric

$V(\Phi)$ = minimal for $|\Phi| = \sqrt{\frac{2\mu^2}{\lambda}} \equiv \frac{v}{\sqrt{2}} > 0$



ground state Φ_0 (=vacuum expectation value of Φ) not unique

specific choice $\Phi_0 = \begin{pmatrix} 0 \\ \frac{v}{\sqrt{2}} \end{pmatrix}$ not gauge invariant ⇒ spontaneous symmetry breaking

elmg. gauge invariance unbroken, since $Q\Phi_0 = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} \Phi_0 = 0$

Field excitations in Φ:

$$\Phi(x) = \begin{pmatrix} \phi^+(x) \\ \frac{1}{\sqrt{2}}\Big(v + H(x) + \mathrm{i}\chi(x)\Big) \end{pmatrix}$$

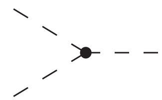
Gauge-invariant Lagrangian of Higgs sector: $(\phi^- = (\phi^+)^\dagger)$

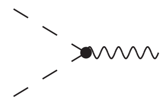
$$\mathcal{L}_\mathrm{H} = (D_\mu\Phi)^\dagger(D^\mu\Phi) - V(\Phi) \qquad \text{with } D_\mu = \partial_\mu - \mathrm{i}g_2\frac{\sigma^a}{2}W_\mu^a + \mathrm{i}\frac{g_1}{2}B_\mu$$

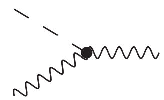
$$= (\partial_\mu\phi^+)(\partial^\mu\phi^-) - \frac{\mathrm{i}ev}{2s_\mathrm{W}}(W_\mu^+\partial^\mu\phi^- - W_\mu^-\partial^\mu\phi^+) + \frac{e^2v^2}{4s_\mathrm{W}^2}W_\mu^+W^{-,\mu}$$

$$+\frac{1}{2}(\partial\chi)^2 + \frac{ev}{2c_\mathrm{W}s_\mathrm{W}}Z_\mu\partial^\mu\chi + \frac{e^2v^2}{4c_\mathrm{W}^2s_\mathrm{W}^2}Z^2 + \frac{1}{2}(\partial H)^2 - \mu^2H^2$$

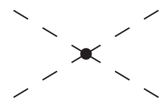
$+$ (trilinear SSS, SSV, SVV interactions)

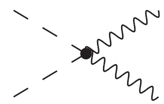






$+$ (quadrilinear $SSSS$, $SSVV$ interactions)





Implications:

- gauge-boson masses: $M_\mathrm{W} = \frac{ev}{2s_\mathrm{W}}, \quad M_\mathrm{Z} = \frac{ev}{2c_\mathrm{W}s_\mathrm{W}} = \frac{M_\mathrm{W}}{c_\mathrm{W}}, \quad M_\gamma = 0$
- physical Higgs boson H: $M_\mathrm{H} = \sqrt{2\mu^2}$ = free parameter
- would-be Goldstone bosons $\phi^\pm$, χ: unphysical degrees of freedom

general gauge: Goldstone fields $\phi^{\pm}$, χ are present

required: gauge fixing term $\mathcal{L}_{fix}$

R_ξ gauge:

$$\mathcal{L}_{fix} = -\frac{1}{2\xi_\gamma}\,(F^\gamma)^2 - \frac{1}{2\xi_Z}\,\left(F^Z\right)^2 - \frac{1}{2\xi_W}\,\left(F^\pm\right)^2$$

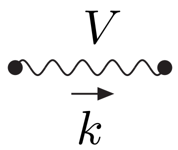
with the gauge-fixing functionals F^a: (ξ_V = arbitrary gauge-fixing parameters)

$$F^\pm = \partial W^\pm \mp \mathrm{i}\xi_\mathrm{W} M_\mathrm{W} \phi^\pm, \qquad F^\mathrm{Z} = \partial Z - \xi_\mathrm{Z} M_\mathrm{Z} \chi, \qquad F^\gamma = \partial A$$

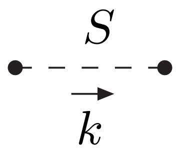
(*notation:* $\partial A = \partial_\mu A^\mu\,,\;\cdots$)

- elimination of mixing terms $(W^{\pm}_{\mu}\partial^{\mu}\phi^{\mp})$, $(Z_{\mu}\partial^{\mu}\chi)$ in Lagrangian
  $\hookrightarrow$ decoupling of gauge and would-be Goldstone fields (no mix propagators)

- boson propagators:



$$D^{VV}_{\mu\nu}(k) = -\mathrm{i}\left[\frac{g_{\mu\nu} - \frac{k_\mu k_\nu}{k^2}}{k^2 - M_V^2} + \frac{k_\mu k_\nu}{k^2}\,\frac{\xi_V}{k^2 - \xi_V M_V^2}\right], \qquad V = W, Z, \gamma$$



$$D^{SS}(k) = \frac{\mathrm{i}}{k^2 - \xi_V M_V^2}, \qquad S = \phi, \chi$$

- important special cases:
  - $\xi_V = 1$: 't Hooft–Feynman gauge
    $\hookrightarrow$ convenient gauge-boson propagators $\dfrac{-\mathrm{i}g_{\mu\nu}}{k^2 - M_V^2}$
  - $\xi_{\mathrm{W}}, \xi_{\mathrm{Z}} \to \infty$: "unitary gauge"
    $\hookrightarrow$ elimination of would-be Goldstone bosons

Fermion masses

fermions in chiral representations of gauge symmetry

$$\begin{pmatrix} \nu_e \\ e \end{pmatrix}_L , \quad e_R \quad \Rightarrow \text{mass term } m_e(\bar{e}_L e_R + \bar{e}_R e_L) = m_e \, \bar{e} e$$

not gauge invariant

solution of the SM: introduce Yukawa interaction

= new interaction of fermions with the Higgs field

gauge invariant interaction, g_e = Yukawa coupling constant

$$\mathcal{L}_{\text{Yuk}} = g_e \, [\, \overline{\psi^L} \, \Phi \, e_R \, + \, \overline{e_R} \, \Phi^\dagger \psi^L \,]$$

most transparent in unitary gauge

$$\Phi = \begin{pmatrix} \phi^+ \\ \phi^0 \end{pmatrix} \to \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ v + H \end{pmatrix}$$

apply to the first lepton generation $\psi^L = \begin{pmatrix} \nu_L \\ e_L \end{pmatrix}, \;\; e_R$:

$$\frac{g_e}{\sqrt{2}} \left[(\overline{\nu_L}, \overline{e_L}) \begin{pmatrix} 0 \\ v + H \end{pmatrix} e_R + \overline{e_R}\,(0, v + H) \begin{pmatrix} \nu_L \\ e_L \end{pmatrix} \right]$$

$$= \underbrace{\frac{g_e}{\sqrt{2}} v}_{m_e} \left[\overline{e_L} e_R + \overline{e_R} e_L \right] + \underbrace{\frac{g_e}{\sqrt{2}}}_{m_e/v} H \left[\overline{e_L} e_R + \overline{e_R} e_L \right]$$

$$= m_e \, \bar{e} e + \frac{m_e}{v} H \, \bar{e} e$$

3 generations of leptons and quarks

Lagrangian for Yukawa couplings:

$$\mathcal{L}_{\rm Yuk} \;=\; -\overline{\Psi}^{\rm L}_{L} G_l \psi^{\rm R}_l \Phi - \overline{\Psi}^{\rm L}_{Q} G_u \psi^{\rm R}_u \tilde{\Phi} - \overline{\Psi}^{\rm L}_{Q} G_d \psi^{\rm R}_d \Phi + \text{h.c.}$$

- G_l, G_u, G_d = 3×3 matrices in 3-dim. space of generations (ν masses ignored)
- $\tilde{\Phi} = i\sigma^2\Phi^* = \begin{pmatrix} \phi^{0*} \\ -\phi^- \end{pmatrix}$ = charge conjugate Higgs doublet, $Y_{\tilde{\Phi}} = -1$

Fermion mass terms:

mass terms = bilinear terms in $\mathcal{L}_{\rm Yuk}$, obtained by setting $\Phi \to \Phi_0$:

$$\mathcal{L}_{m_f} \;=\; -\frac{v}{\sqrt{2}}\overline{\psi^{\rm L}_l} G_l \psi^{\rm R}_l - \frac{v}{\sqrt{2}}\overline{\psi^{\rm L}_u} G_u \psi^{\rm R}_u - \frac{v}{\sqrt{2}}\overline{\psi^{\rm L}_d} G_d \psi^{\rm R}_d + \text{h.c.}$$

$\hookrightarrow$ diagonalization by unitary field transformations $(f = l, u, d)$

$\hat{\psi}^{\rm L/R}_f \equiv U^{\rm L/R}_f \psi^{\rm L/R}_f$ such that $\frac{v}{\sqrt{2}} U^{\rm L}_f G_f (U^{\rm R}_f)^\dagger = {\rm diag}(m_f)$

$\Rightarrow$ standard form: $\mathcal{L}_{m_f} \;=\; -m_f \overline{\hat{\psi}^{\rm L}_f} \hat{\psi}^{\rm R}_f + \text{h.c.} \;=\; -m_f \overline{\hat{\psi}_f} \hat{\psi}_f$

Quark mixing:

- ψ_f correspond to eigenstates of the gauge interaction
- $\hat{\psi}_f$ correspond to mass eigenstates,
  for massless neutrinos define $\hat{\psi}^{\mathrm{L}}_{\nu} \equiv U^{\mathrm{L}}_{l} \psi^{\mathrm{L}}_{\nu}$ $\rightarrow$ no lepton-flavour changing

Yukawa and gauge interactions in terms of mass eigenstates:

$$\mathcal{L}_{\mathrm{Yuk}} = -\frac{\sqrt{2}m_l}{v}\left(\phi^+\overline{\hat{\psi}^{\mathrm{L}}_{\nu_l}}\hat{\psi}^{\mathrm{R}}_l + \phi^-\overline{\hat{\psi}^{\mathrm{R}}_l}\hat{\psi}^{\mathrm{L}}_{\nu_l}\right) + \frac{\sqrt{2}m_u}{v}\left(\phi^+\overline{\hat{\psi}^{\mathrm{R}}_u}V\hat{\psi}^{\mathrm{L}}_d + \phi^-\overline{\hat{\psi}^{\mathrm{L}}_d}V^\dagger\hat{\psi}^{\mathrm{R}}_u\right)$$

$$- \frac{\sqrt{2}m_d}{v}\left(\phi^+\overline{\hat{\psi}^{\mathrm{L}}_u}V\hat{\psi}^{\mathrm{R}}_d + \phi^-\overline{\hat{\psi}^{\mathrm{R}}_d}V^\dagger\hat{\psi}^{\mathrm{L}}_u\right) - \frac{m_f}{v}\mathrm{i}\,\mathrm{sgn}(T^3_{\mathrm{I},f})\chi\,\overline{\hat{\psi}_f}\gamma_5\hat{\psi}_f$$

$$- \frac{m_f}{v}(v+H)\,\overline{\hat{\psi}_f}\hat{\psi}_f,$$

$$\mathcal{L}_{\mathrm{ferm,YM}} = \frac{e}{\sqrt{2}s_{\mathrm{W}}}\overline{\hat{\Psi}^{\mathrm{L}}_L}\begin{pmatrix} 0 & \not{W}^+ \\ \not{W}^- & 0 \end{pmatrix}\hat{\psi}^{\mathrm{L}}_L + \frac{e}{\sqrt{2}s_{\mathrm{W}}}\overline{\hat{\Psi}^{\mathrm{L}}_Q}\begin{pmatrix} 0 & V\not{W}^+ \\ V^\dagger\not{W}^- & 0 \end{pmatrix}\hat{\psi}^{\mathrm{L}}_Q$$

$$+ \frac{e}{2c_{\mathrm{W}}s_{\mathrm{W}}}\overline{\hat{\Psi}^{\mathrm{L}}_F}\sigma^3\not{Z}\hat{\Psi}^{\mathrm{L}}_F - e\frac{s_{\mathrm{W}}}{c_{\mathrm{W}}}Q_f\overline{\hat{\psi}_f}\not{Z}\hat{\psi}_f - eQ_f\overline{\hat{\psi}_f}\not{A}\hat{\psi}_f$$

- only charged-current coupling of quarks modified by $V = U^{\mathrm{L}}_u(U^{\mathrm{L}}_d)^\dagger$ = unitary

  (Cabibbo–Kobayashi–Maskawa (CKM) matrix)

- Higgs–fermion coupling strength = $\dfrac{m_f}{v}$

Features of the CKM mixing:

- V = 3-dim. generalization of Cabibbo matrix U_{C}
- V is parametrized by 4 free parameters: 3 real angles, 1 complex phase

  $\hookrightarrow$ complex phase is the only source of CP violation in SM

  counting:

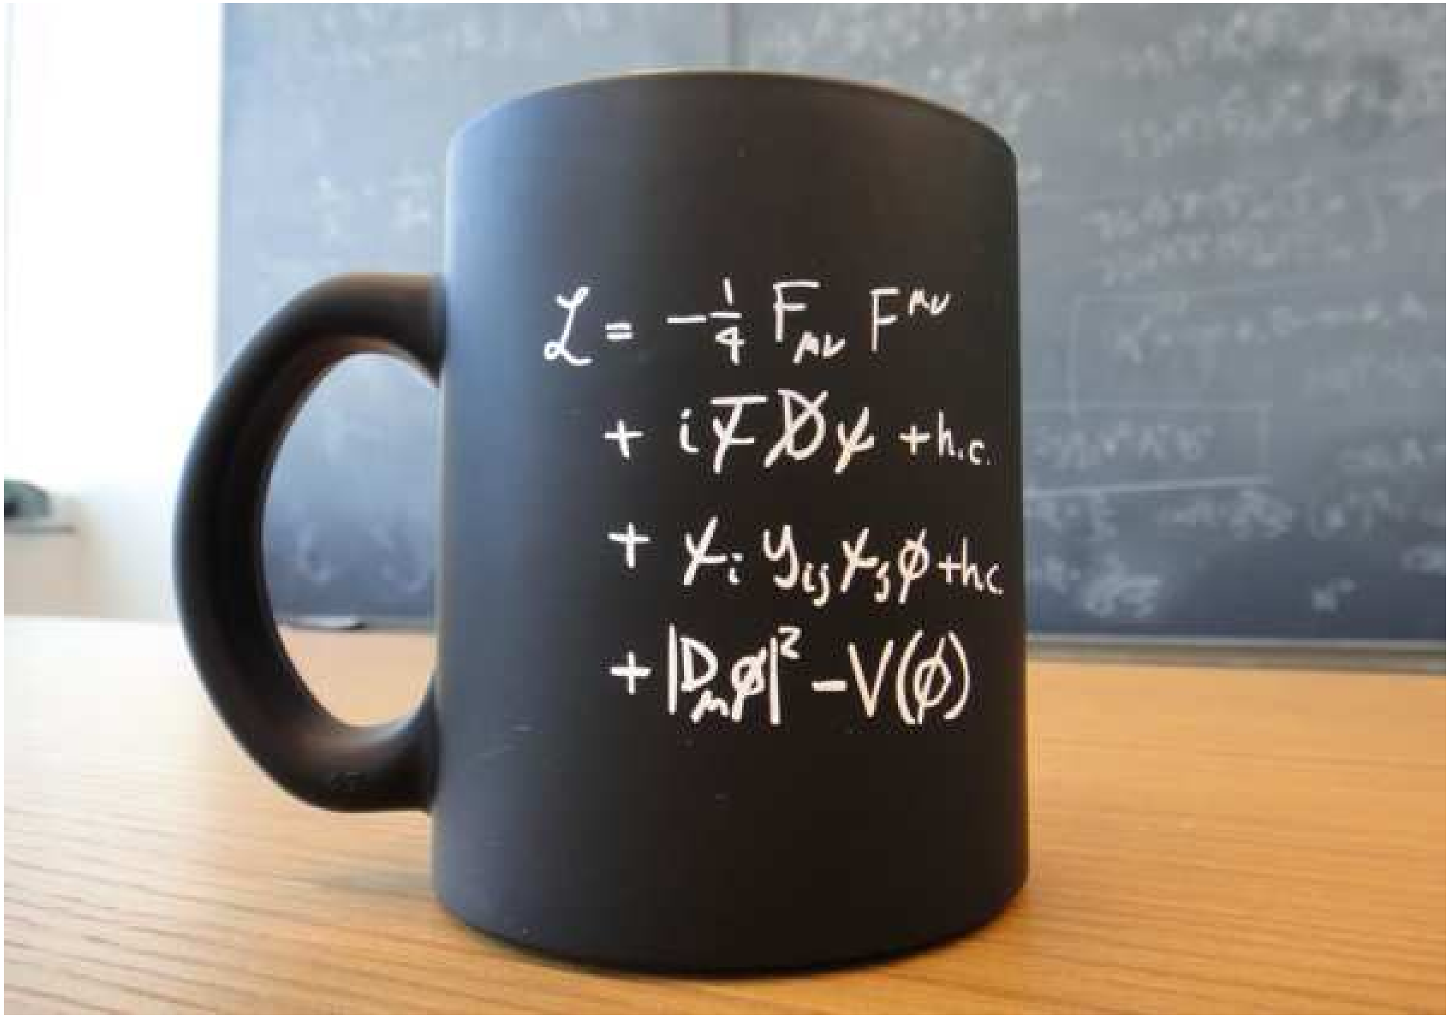
  $$\begin{pmatrix}\text{\#real d.o.f.}\\ \text{in } V\end{pmatrix} - \begin{pmatrix}\text{\#unitarity}\\ \text{relations}\end{pmatrix} - \begin{pmatrix}\text{\#phase diffs. of}\\ u\text{-type quarks}\end{pmatrix} - \begin{pmatrix}\text{\#phase diffs. of}\\ d\text{-type quarks}\end{pmatrix} - \begin{pmatrix}\text{\#phase diff. between}\\ u\text{- and } d\text{-type quarks}\end{pmatrix}$$

  $$= 18 - 9 - 2 - 2 - 1 = 4$$
- no flavour-changing neutral currents in lowest order,

  flavour-changing suppressed by factors $G_\mu(m_{q_1}^2 - m_{q_2}^2)$ in higher orders

  (“Glashow–Iliopoulos–Maiani mechanism”)

The Standard Model Lagrangian



- renormalizable $\Rightarrow$ precision calculations
- quantum effects in precision observables detectable
- involve Higgs mass dependence

6. Phenomenology of W and Z bosons and precision tests

Cross sections and decay widths

scattering process: $a + b \quad \rightarrow \quad b_1 + b_2 + \cdots + b_n$

$$|a(p_a), b(p_b)> = |i>, \quad |b_1(p_1), \cdots b_n(p_n)> = |f>$$

matrix element = probability amplitude for $i \rightarrow f$:

$$S_{fi} = < f|S|i >$$

for $i \neq f$: $\quad S_{fi} = (2\pi)^4\, \delta^4(P_i - P_f)\, \mathcal{M}_{fi}\, \left[\frac{1}{(2\pi)^{3/2}}\right]^{n+2}$

$P_i = p_a + p_b \ = \ P_f = p_1 + \cdots + p_n$ momentum conservation

factors $(2\pi)^{-3/2}$ from wave function normalization
(plane waves)

$\mathcal{M}_{fi}$ from Feynman graphs and rules probability for scattering into phase space element $\mathrm{d}\Phi$:

$$\mathrm{d}W_{fi} = |S_{fi}|^2 \,\mathrm{d}\Phi, \qquad \mathrm{d}\Phi = \frac{\mathrm{d}^3 p_1}{2p_1^0} \cdots \frac{\mathrm{d}^3 p_n}{2p_n^0}$$

$$\frac{\mathrm{d}^3 p_i}{2p_i^0} = \mathrm{d}^4 p_i \,\delta(p_i^2 - m_i^2)$$ Lorentz invariant phase space

differential cross section:

$$\mathrm{d}\sigma = \frac{(2\pi)^4}{4\sqrt{(p_a \cdot p_b)^2 - m_a^2 m_b^2}} \; |\mathcal{M}_{fi}|^2 \,(2\pi)^{-3n} \,\delta^4(P_i - P_f) \,\frac{\mathrm{d}^3 p_1}{2p_1^0} \cdots \frac{\mathrm{d}^3 p_n}{2p_n^0}$$

decay process: $a \quad \rightarrow \quad b_1 + b_2 + \cdots + b_n$

$$|a(p_a)> = |i>, \quad |b_1(p_1), \cdots b_n(p_n)> = |f>$$

$$S_{fi} = (2\pi)^4 \, \delta^4(p_a - P_f) \, \mathcal{M}_{fi} \, \left[\frac{1}{(2\pi)^{3/2}}\right]^{n+1}$$

decay width (differential):

$$\boxed{\mathrm{d}\Gamma = \frac{(2\pi)^4}{2\,m_a} \; |\mathcal{M}_{fi}|^2 \; (2\pi)^{-3n} \; \delta^4(p_a - P_f) \; \frac{\mathrm{d}^3 p_1}{2p_1^0} \; \cdots \; \frac{\mathrm{d}^3 p_n}{2p_n^0}}$$

special case: 2-particle phase space

$$a + b \to b_1 + b_2, \qquad a \to b_1 + b_2$$

- **cross section**

in the CMS, $\vec{p}_a + \vec{p}_b = 0 = \vec{p}_1 + \vec{p}_2$

$$\boxed{\frac{\mathrm{d}\sigma}{\mathrm{d}\Omega} = \frac{1}{64\pi^2 s} \frac{|\vec{p}_1|}{|\vec{p}_a|} \, |\mathcal{M}_{fi}|^2}$$

$$\mathrm{d}\Omega = \mathrm{d}\cos\theta \, \mathrm{d}\phi, \qquad \theta = \sphericalangle(\vec{p}_a, \vec{p}_1)$$

$$s = (p_a + p_b)^2 = E^2_{\mathrm{CMS}}$$

- **decay rate**

for final state masses $m_1 = m_2 = m$

$$\boxed{\frac{\mathrm{d}\Gamma}{\mathrm{d}\Omega} = \frac{1}{64\pi^2 \, m_a} \sqrt{1 - \frac{4m^2}{m_a^2}} \, |\mathcal{M}_{fi}|^2}$$

features of the ew Standard Model

- Higgs boson probably found, all other particles confirmed
- consistent quantum field theory
  - in accordance with unitarity
  - renormalizable $\Rightarrow$ predictions at higher orders
- formal parameters: $g_2,\, g_1,\, v,\, \lambda,\, g_f,\, V_{\mathrm{CKM}}$
  physical parameters: $\alpha,\, M_W,\, M_Z,\, M_H,\, m_f,\, V_{\mathrm{CKM}}$

Basic parameters and relations

ew mixing angle: $s_{\mathrm{W}} \equiv \sin\theta_{\mathrm{W}}, \quad c_{\mathrm{W}} \equiv \cos\theta_{\mathrm{W}}$

gauge coupling constants: $g_2 = \frac{e}{s_{\mathrm{W}}}, \quad g_1 = \frac{e}{c_{\mathrm{W}}}$

vector boson masses:

$$M_W = \tfrac{1}{2} g_2 v = \frac{ev}{2s_{\mathrm{W}}}$$

$$M_Z = \frac{ev}{2s_{\mathrm{W}}c_{\mathrm{W}}} = \frac{M_W}{c_{\mathrm{W}}}$$

$$s_{\mathrm{W}}^2 = 1 - \frac{M_W^2}{M_Z^2}$$

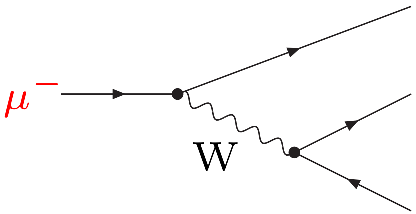
neutral current (NC) couplings:

$$a_f = \frac{g_2}{2c_{\mathrm{W}}}\, T_3^f$$

$$v_f = \frac{g_2}{2c_{\mathrm{W}}}\, (T_3^f - 2Q_f s_{\mathrm{W}})$$

observables and experiments

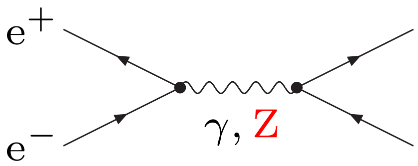
- Muon decay: $\mu^- \to \nu_\mu e^- \bar{\nu}_e$



determination of the Fermi constant

$$G_\mu = \frac{\pi \alpha M_Z^2}{\sqrt{2} M_W^2 (M_Z^2 - M_W^2)} + \ldots$$

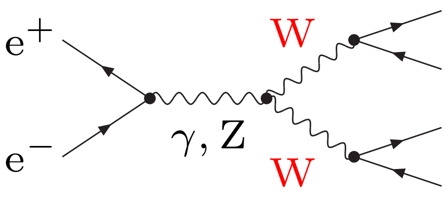
- Z production (LEP1/SLC): $e^+e^- \to Z \to f\bar{f}$

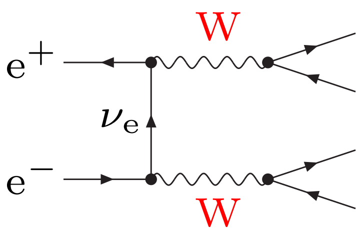


various precision measurements at the Z resonance: $M_Z, \Gamma_Z, \sigma_{had}, A_{FB}, A_{LR}, \mathrm{etc.}$

$\Rightarrow$ good knowledge of the $Zf\bar{f}$ sector

- W-pair production (LEP2/ILC): $e^+e^- \to WW \to 4f(+\gamma)$





– measurement of M_W

– γWW/ZWW couplings

– quartic couplings: $\gamma\gamma WW$, γZWW

experiments at hadron colliders

- W production (Tevatron/LHC): $\mathrm{pp}, \mathrm{p\bar{p}} \to \mathrm{W} \to l\nu_l(+\gamma)$

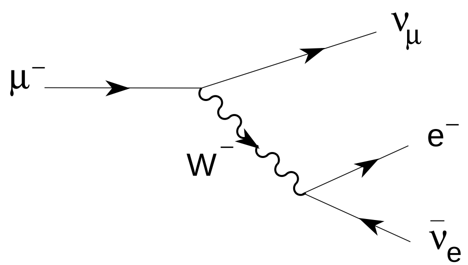
  – measurement of M_W

  – bounds on $\gamma\mathrm{WW}$ coupling

- top-quark production (Tevatron/LHC): $\mathrm{pp}, \mathrm{p\bar{p}} \to \mathrm{t\bar{t}} \to 6f$

  – measurement of m_t

μ decay



$$\mathcal{M} = \left(\frac{ig_2}{2\sqrt{2}}\right)^2 J_\rho^{(\mu)} \frac{-ig^{\rho\sigma}}{q^2 - M_W^2} J_\sigma^{(e)}$$

$$|q|^2 \simeq m_\mu^2 \ll M_W^2 : \qquad \mathcal{M} = -\frac{g_2^2}{8M_W^2} J_\rho^{(\mu)} J^{\rho\,(e)}$$

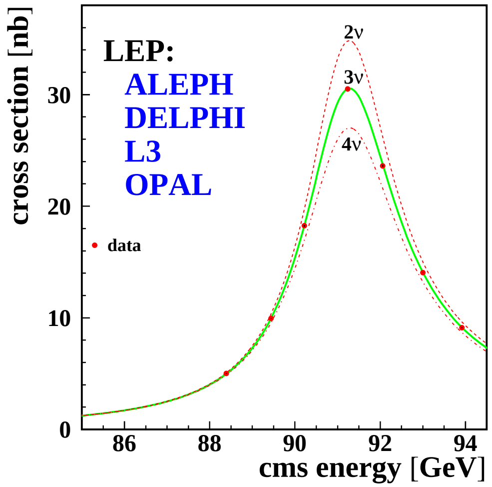
Fermi model *with point-like 4-fermion interaction:*

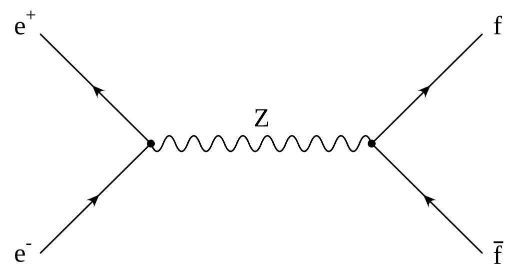
$$\mathcal{M} = \frac{G_F}{\sqrt{2}} J_\rho^{(\mu)} J^{\rho\,(e)}$$ *low-energy limit of SM*

$$\Rightarrow \quad \boxed{\frac{G_F}{\sqrt{2}} = \frac{g_2^2}{8M_W^2} = \frac{e^2}{8s_W^2 c_W^2 M_Z^2} = \frac{\pi\alpha}{2s_W^2 c_W^2 M_Z^2} = \frac{\pi\alpha}{2(1-M_W^2/M_Z^2)M_W^2}}$$

$$G_F = 1.16637(1) \cdot 10^{-5}\,\mathrm{GeV}^{-2}$$

Z resonance





$$\mathcal{M} = J_\mu^{(e)} \, \frac{-ig^{\mu\nu}}{s - M_Z^2 + iM_Z\Gamma_Z} \, J_\nu^{(f)}$$

propagator with finite width Γ_Z *(unstable particle)*

$$\Gamma_Z = \sum_f \Gamma(Z \to f\bar{f}), \quad \Gamma(Z \to f\bar{f}) = \frac{M_Z}{12\pi}\,(v_f^2 + a_f^2)$$

differential cross section at $s = M_Z^2$:

$$\frac{d\sigma}{d\Omega} \sim (v_e^2 + a_e^2)(v_f^2 + a_f^2)\,(1 + \cos^2\theta) \; + \; (2v_e a_e)(2v_f a_f) \cdot 2\cos\theta$$

$\Rightarrow$ *forward-backward asymmetry* $A_{FB} = \frac{\sigma_F - \sigma_B}{\sigma_F + \sigma_B} = \frac{3}{4} A_e A_f$

$$A_f = \frac{2v_f a_f}{v_f^2 + a_f^2}$$

polarized cross section for $e^-_{L,R}$:

$\Rightarrow$ *left-right asymmetry* $A_{LR} = \frac{\sigma_L - \sigma_R}{\sigma_L + \sigma_R} = A_e$

asymmetries determine $\sin^2\theta_W$

$$\frac{v_f}{a_f} = 1 - 4\,|Q_f|\,\sin^2\theta_W$$

input from experiments

- LEP1/SLC: $e^+e^- \to Z \to f\bar{f}$
  LEP1: $\sim 4 \times 10^6$ events/experiment
  4 experiments (1989 – 1995)

- LEP2: $e^+e^- \to W^+W^-$
  $\mathcal{O}(10^4)$ W pairs (1996 – 2000)

- Tevatron: $q\bar{q}' \to W \to l\nu, q\bar{q}'$
  (p$\bar{\text{p}}$) $q\bar{q}' \to t\bar{t},\ t \to W^+b \to \ldots$

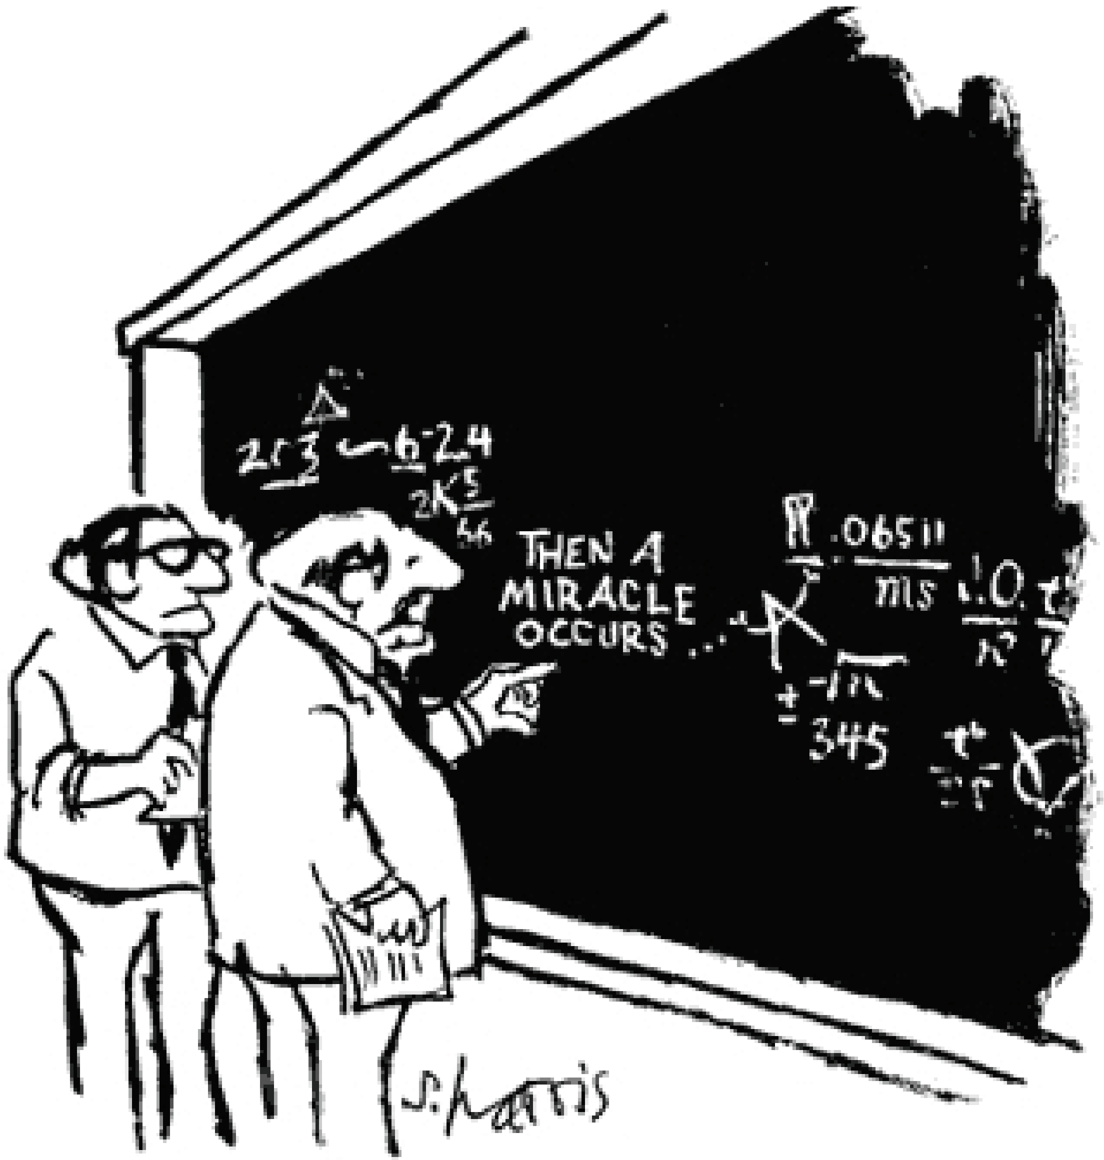
- low-energy experiments (μ decay, νN scattering, νe scattering, atomic parity violation, …)

experimental results (selection)

M_Z [GeV]	$= 91.1875 \pm 0.0021$	0.002%
Γ_Z [GeV]	$= 2.4952 \pm 0.0023$	0.09%
$\sin^2\theta_{eff}^{lept}$	$= 0.23148 \pm 0.00017$	0.07%
M_W [GeV]	$= 80.385 \pm 0.015$	0.02%
m_t [GeV]	$= 173.2 \pm 0.9$	0.52%
G_F [GeV^{-2}]	$= 1.16637(1) 10^{-5}$	0.001%

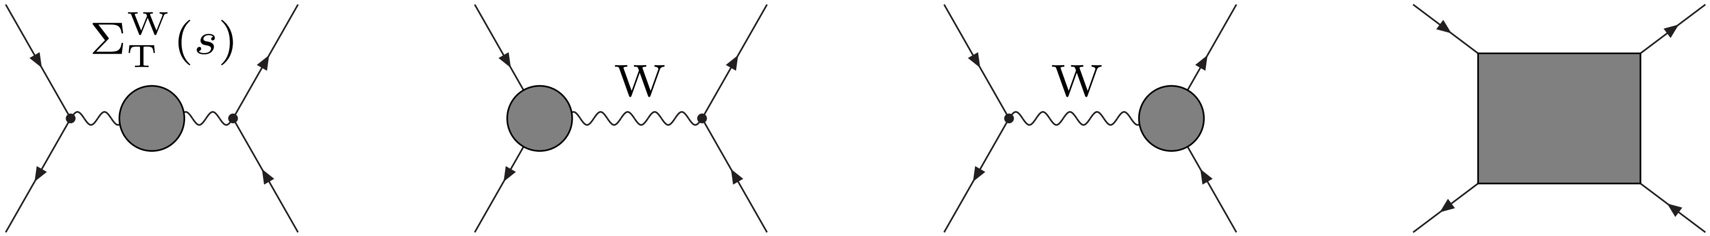
loop effects are at least one order of magnitude larger than experimental uncertainties

precise experiments need precise calculations

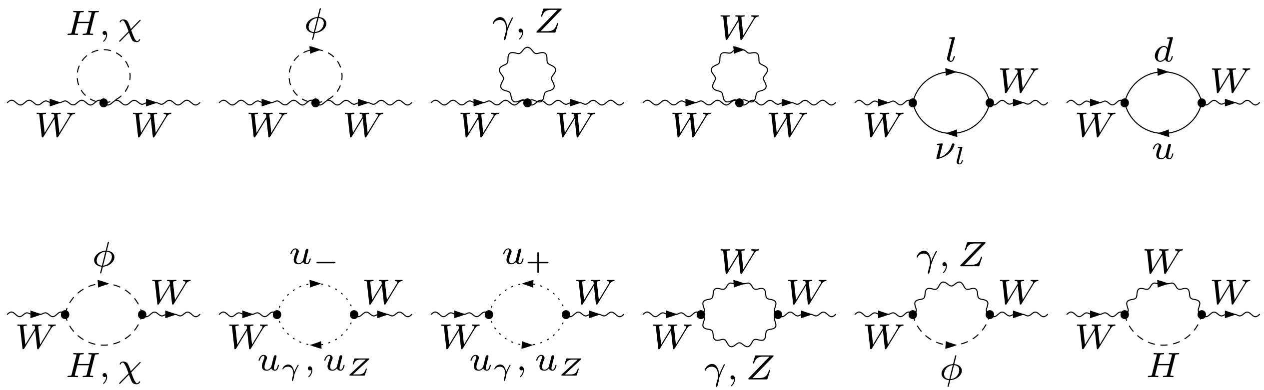


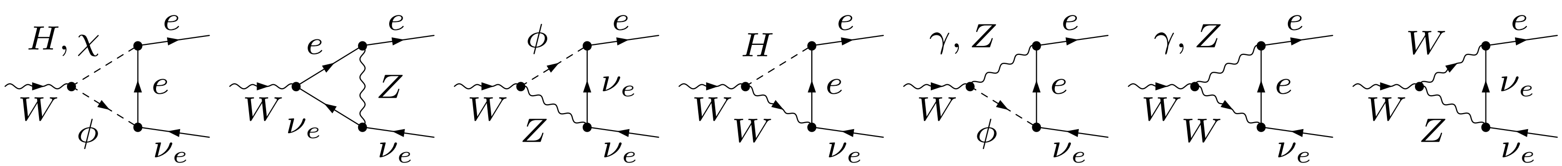
"I think you should be more explicit here in step two."

example: 1-loop diagrams for μ decay amplitude

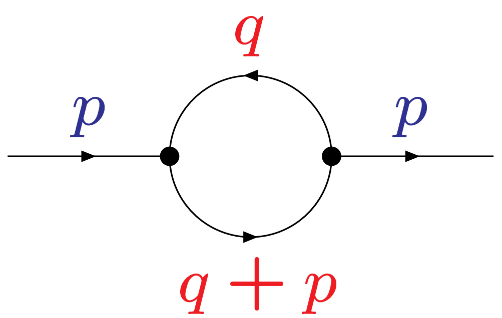


W self-energy — $Wl\nu_l$ vertex correction — box diagrams





Example of loop integral:



$$\sim \int d^4q \frac{1}{(q^2 - m_1^2)\left[(q+p)^2 - m_2^2\right]}$$

$$q \to \infty: \quad \sim \int^{\infty} \frac{q^3 dq}{q^4} = \int^{\infty} \frac{dq}{q} \quad \to \infty$$

$\Rightarrow$ integral diverges for large q

$\Rightarrow$ theory in this form not physically meaningful

needs (i) regularization

(ii) renormalization

Regularization:

theory modified such that expressions become mathematically meaningful

⇒ “regulator” introduced, removed at the end

e.g. cut-off in loop integral

$$\int_0^\infty d^4q \;\to\; \int_0^\Lambda d^4q; \quad \Lambda \to \infty \text{ at the end}$$

technically more convenient: dimensional regularization

$$\int d^4q \;\to\; \int d^Dq, \quad D = 4 - \varepsilon; \quad D \to 4 \text{ at the end}$$

Renormalization:

- absorption of divergencies
- determination of physical meaning of parameters order by order in perturbation theory

add counterterms that absorb divergent parts

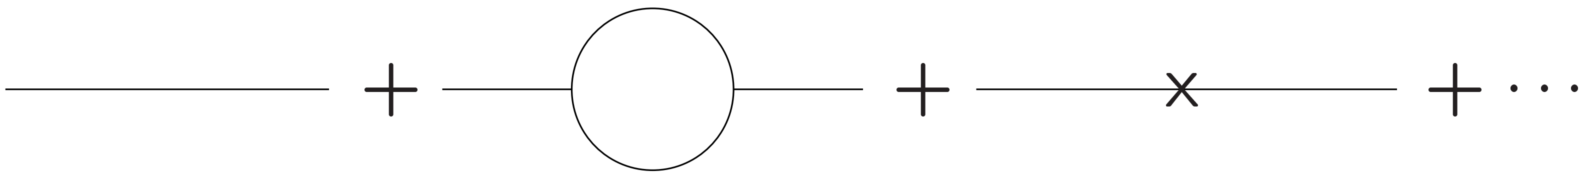
- parameters in $\mathcal{L}$ are formal, "bare parameters"

  $g_0 = g + \delta g$ *for a coupling,* $m_0 = m + \delta m$ *for a mass*
- g, m are "physical", *i.e.* measurable

mass renormalization, $m_0^2 = m^2 + \delta m^2$

Physical mass: pole of propagator

inverse propagator up to 1-loop order:



$p^2 - m^2$ $\qquad \Sigma(p^2)$ $\qquad - \delta m^2$

on-shell renormalization: $\delta m^2 = \mathrm{Re}\,\Sigma(m^2)$

charge renormalization: $e_0 = e + \delta e$

δe *cancels loop contributions to* $ee\gamma$ *vertex in the Thomson limit*

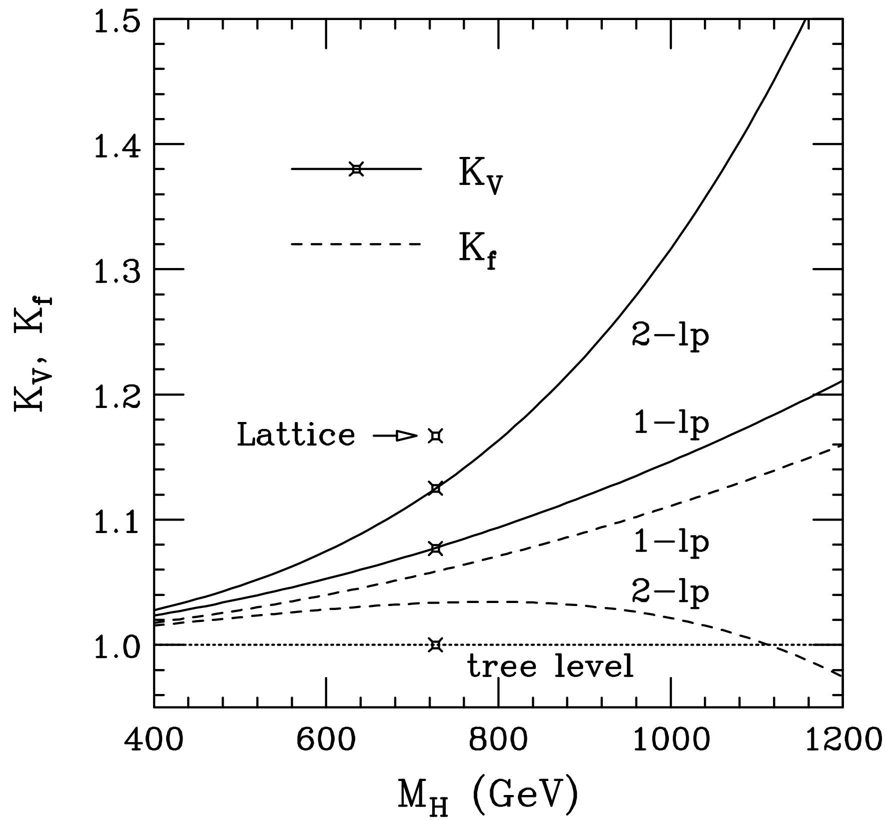
Theoretical bounds on Higgs boson mass

- perturbativity $\to$ upper bound
- unitarity $\to$ upper bound
- Landau pole $\to$ upper bound
- vacuum stability $\to$ lower bound

perturbativity

decay widths into fermions: $\Gamma(H \to f\bar{f}) = \Gamma_{\rm tree} \cdot K_f$

decay widths into vector bosons: $\Gamma(H \to V\bar{V}) = \Gamma_{\rm tree} \cdot K_V$



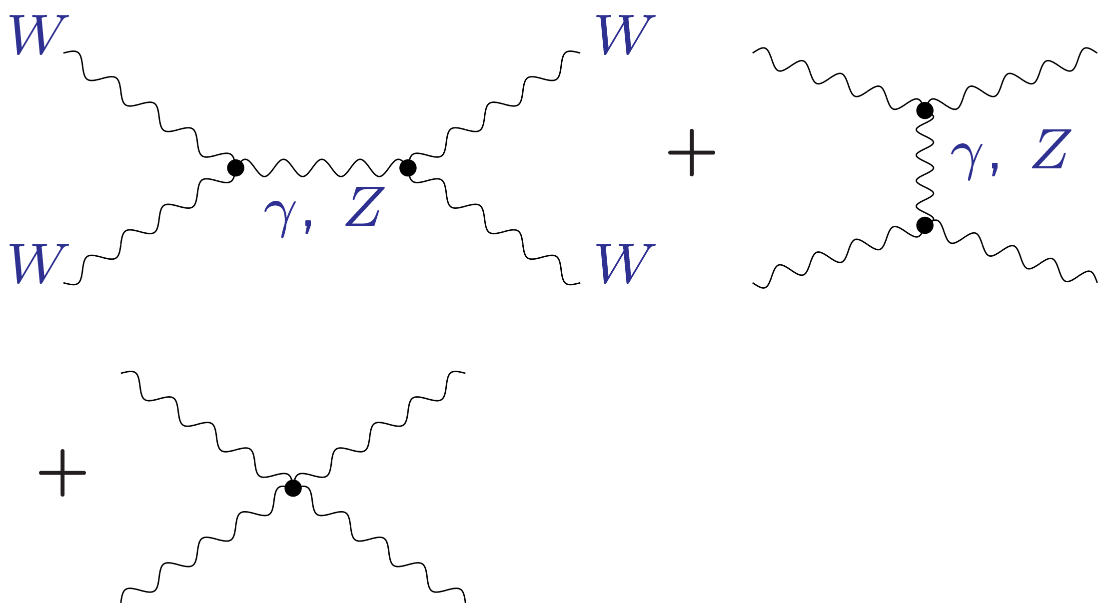
[Ghinculov; Frinck, Kniehl, Riesselmann]

unitarity

scattering of longitudinally polarized W bosons:

$$W_L W_L \to W_L W_L$$

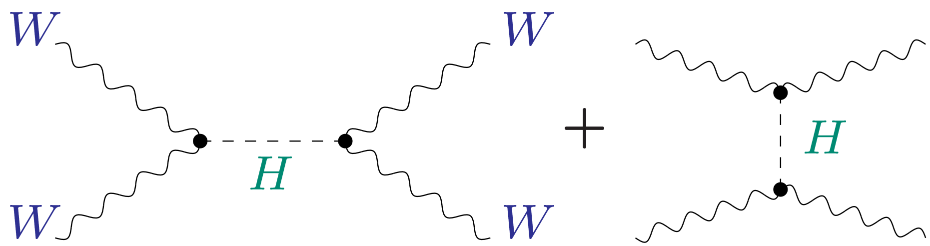
$\mathcal{M}_V =$



$$= -g^2 \frac{E^2}{M_W^2} + \mathcal{O}(1) \qquad \text{for } E \to \infty$$

Extra contribution from scalar particle:

$\mathcal{M}_S =$



$$= g^2_{WWH}\frac{E^2}{M^4_{\mathrm{W}}} + \mathcal{O}(1) \qquad \text{for } E \to \infty$$

$$\mathcal{M} \quad = \mathcal{M}_V + \mathcal{M}_S$$

$\Rightarrow$ terms with bad high-energy behavior cancel for

$$g_{WWH} = g\, M_{\mathrm{W}}$$

for $s >> M_W^2$, with $t = -\frac{s}{2}\,(1 - \cos\theta)$,

$$\mathcal{M} \approx \frac{M_H^2}{v^2}\left(2 + \frac{M_H^2}{s - M_H^2} + \frac{M_H^2}{t - M_H^2}\right)$$

partial wave expansion:

$$\mathcal{M}(s,t) \;=\; 8\pi \sum_{l=0}^{\infty} (2l+1)\, P_l(\cos\theta)\, a_l$$

unitarity condition: $|a_l| < 1$

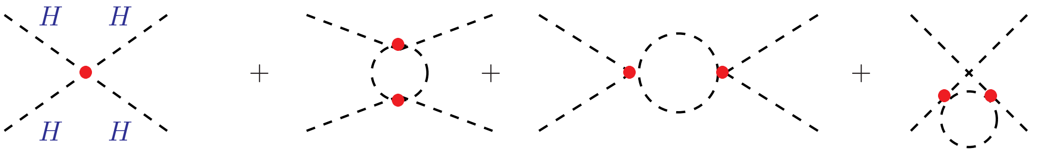
project on $l = 0$ partial wave:

$$\begin{aligned}
a_0 \;&=\; \frac{1}{16\pi} \int_{-1}^{1} d\cos\theta\, \mathcal{M}(s,t) \\
&=\; \frac{M_H^2}{8\pi v^2} \left[2 + \frac{M_H^2}{s - M_H^2} - \frac{M_H^2}{s} \log\left(1 + \frac{s}{M_H^2}\right)\right] \\
&\approx\; \frac{M_H^2}{4\pi v^2} \quad \text{for} \quad s >> M_H^2
\end{aligned}$$

$$\boxed{a_0 < 1 \quad \Rightarrow \quad M_H < 872\,\mathrm{GeV}}$$

Landau pole

Higgs self coupling is scale dependent, $\lambda(Q)$



variation with scale Q described by RGE

$$Q^2 \frac{d\lambda}{dQ^2} = \beta(\lambda) = \frac{3}{4\pi^2}\,\lambda^2$$

solution:

$$\lambda(Q) = \frac{\lambda(v)}{1 - \frac{3}{4\pi^2}\lambda(v)\log\frac{Q^2}{v^2}} \quad \text{with} \quad \lambda(v) = \frac{M_H^2}{2v^2}$$

diverges at scale $Q = \Lambda_C$ (Landau pole)

$$\Lambda_C = v\,\exp\left(\frac{4\pi^2 v^2}{3M_H^2}\right)$$

self-coupling diverges at

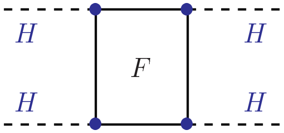
$$\Lambda_C = v \, \exp\left(\frac{4\pi^2 v^2}{3M_H^2}\right)$$

maximum Higgs mass by condition $\Lambda_C > M_H$

$$\Rightarrow \quad M_H < 800\,\mathrm{GeV}$$

vacuum stability

top-quark Yukawa coupling $g_t \sim m_t$ contributes to the running Higgs self coupling $\lambda(Q)$ through top loop $\sim g_t^4$



variation with scale Q described by RGE

$$Q^2 \frac{d\lambda}{dQ^2} = \frac{3}{4\pi^2} \left(\lambda^2 - \frac{m_t^4}{v^4} \right)$$

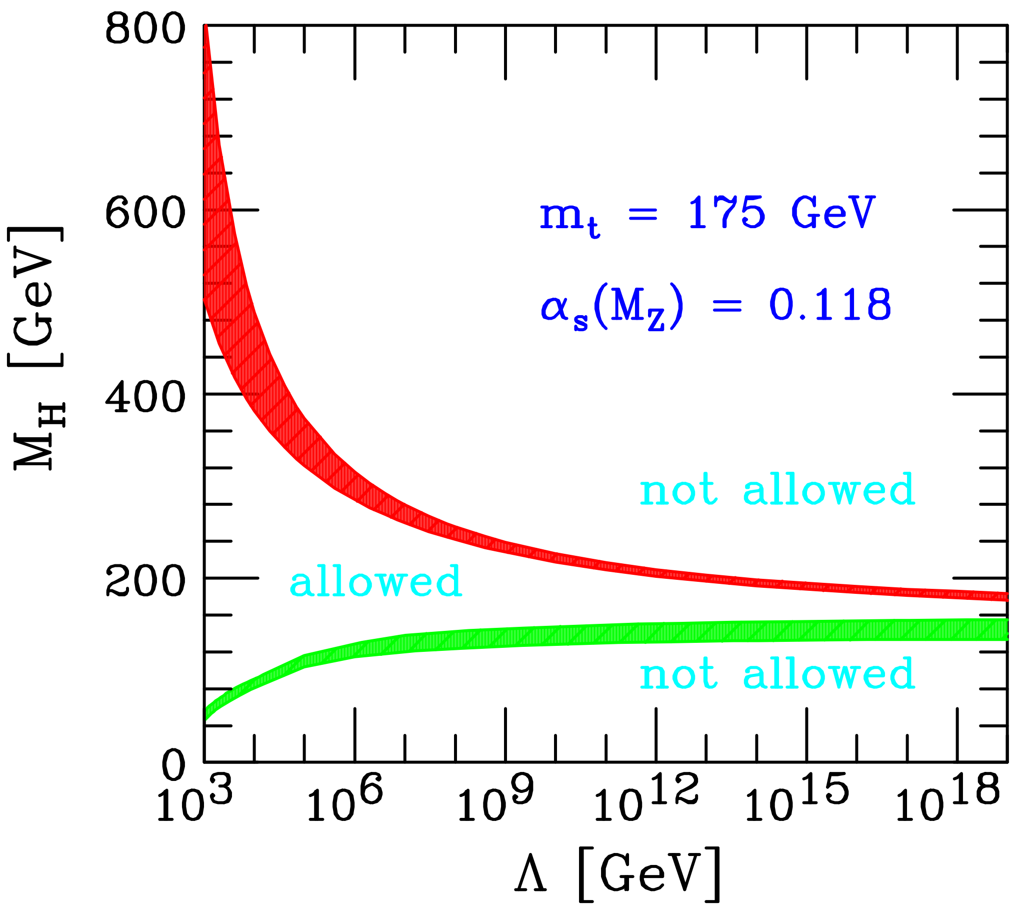
approximate solution:

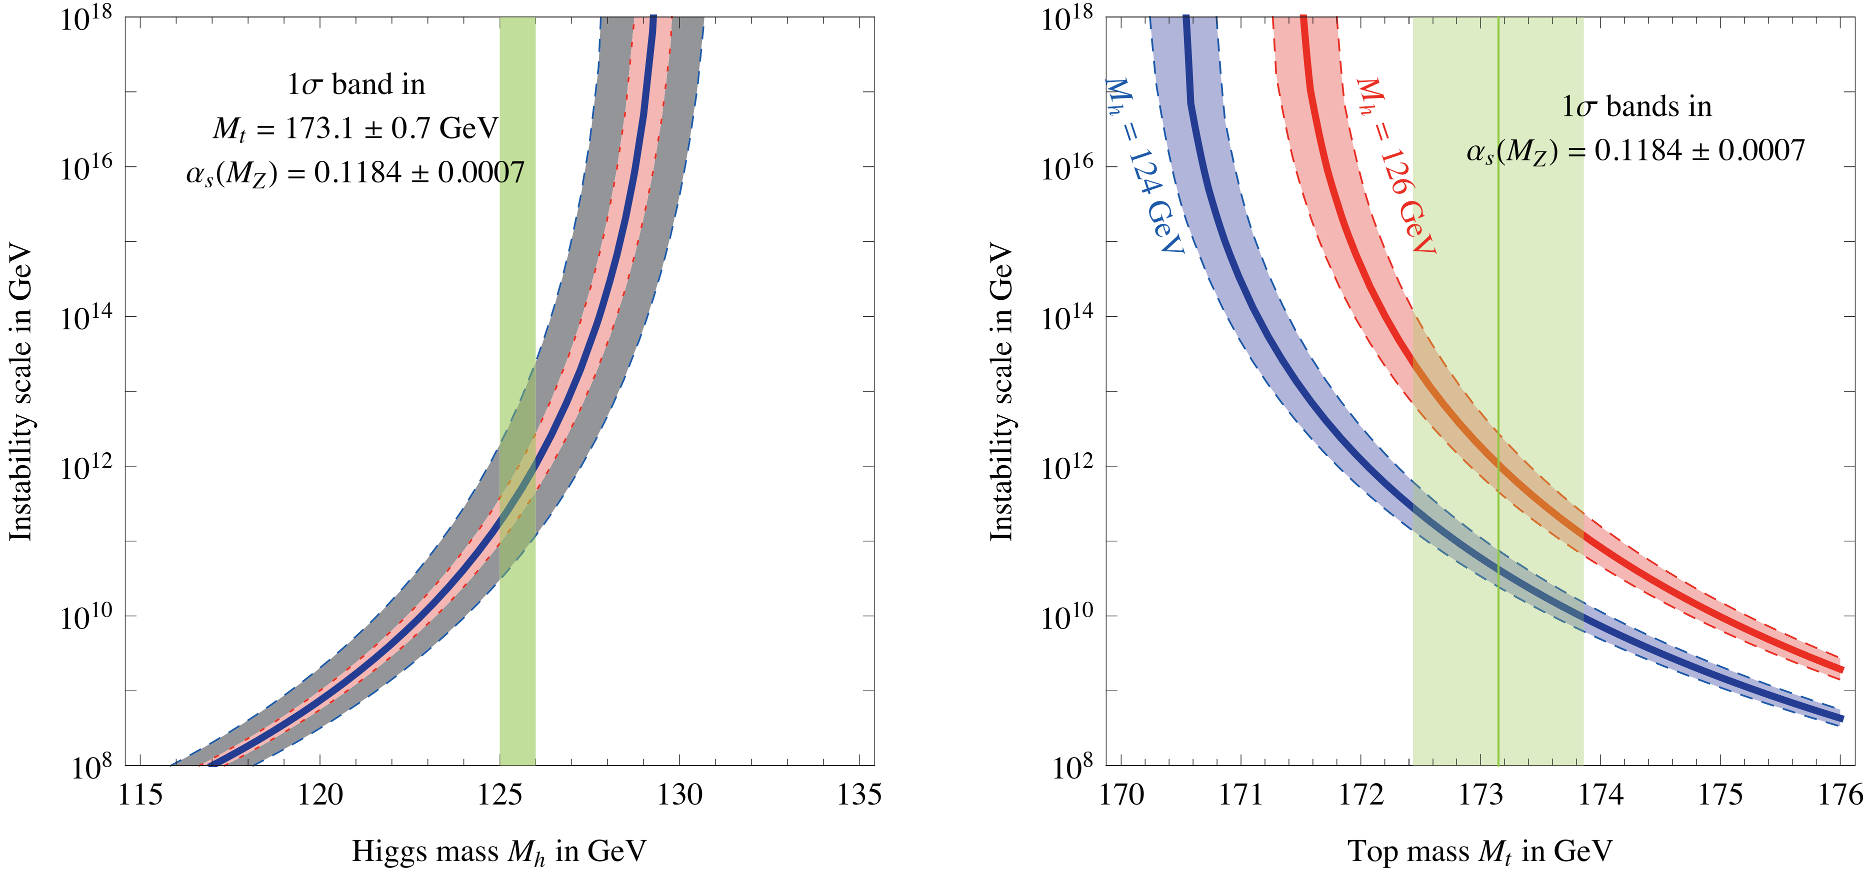
$$\lambda(Q) = \lambda(v) - \frac{3 m_t^4}{2\pi^2 v^4} \log \frac{Q}{v}$$

$\lambda(Q) < 0$ for $Q > \Lambda_C$ $\rightarrow$ vacuum not stable

high value of Λ_C needs M_H large enough combined effects:

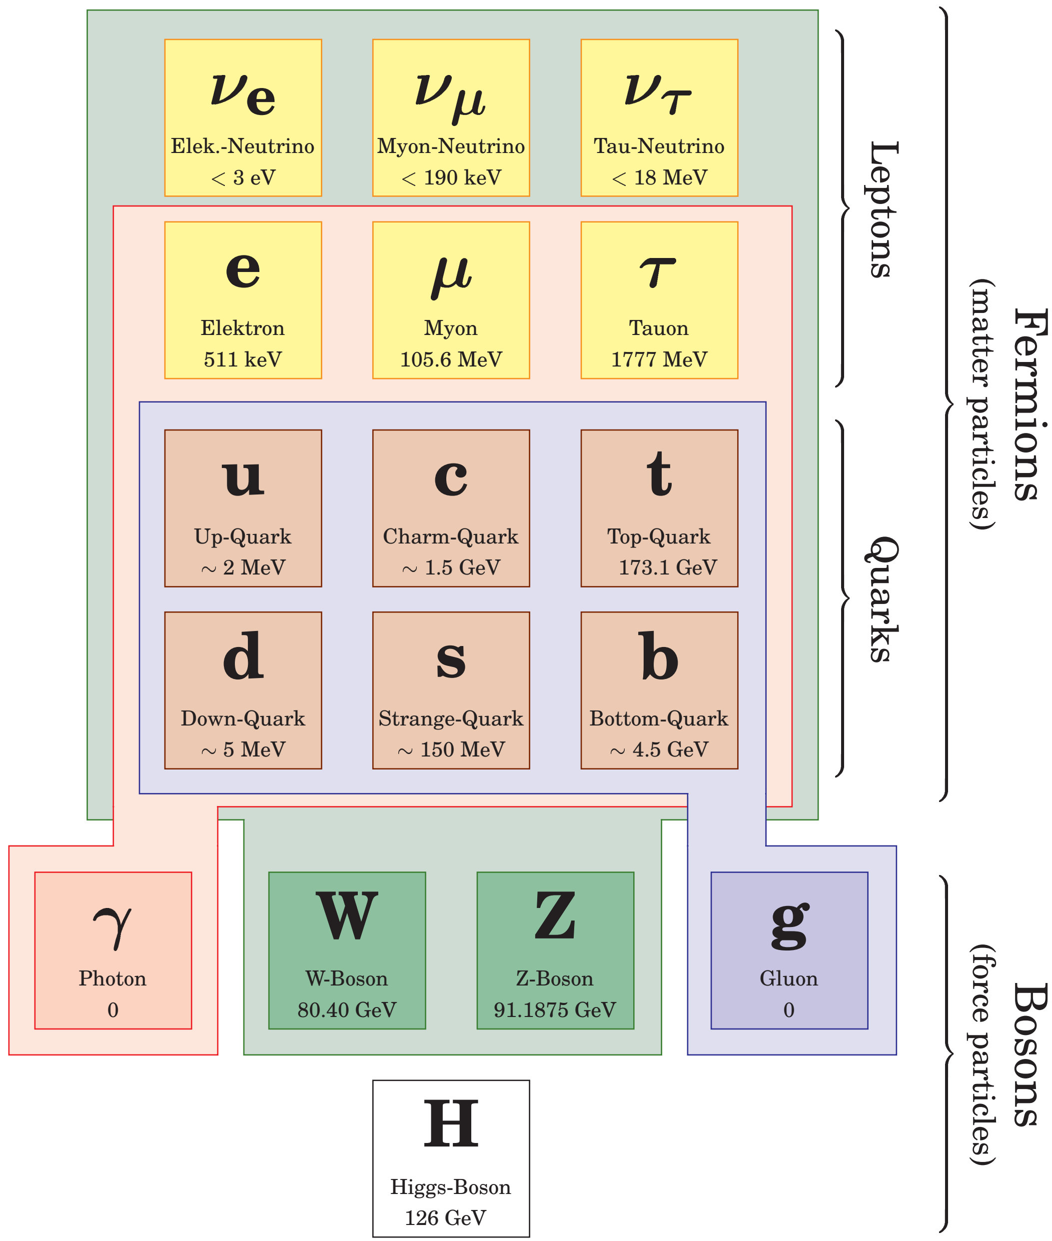
$$\frac{d\lambda}{dt} = \frac{1}{16\pi^2}\,\left(12\lambda^2 - 3\,g_t^4 + 6\,\lambda\,g_t^2\; + \cdots\right)$$





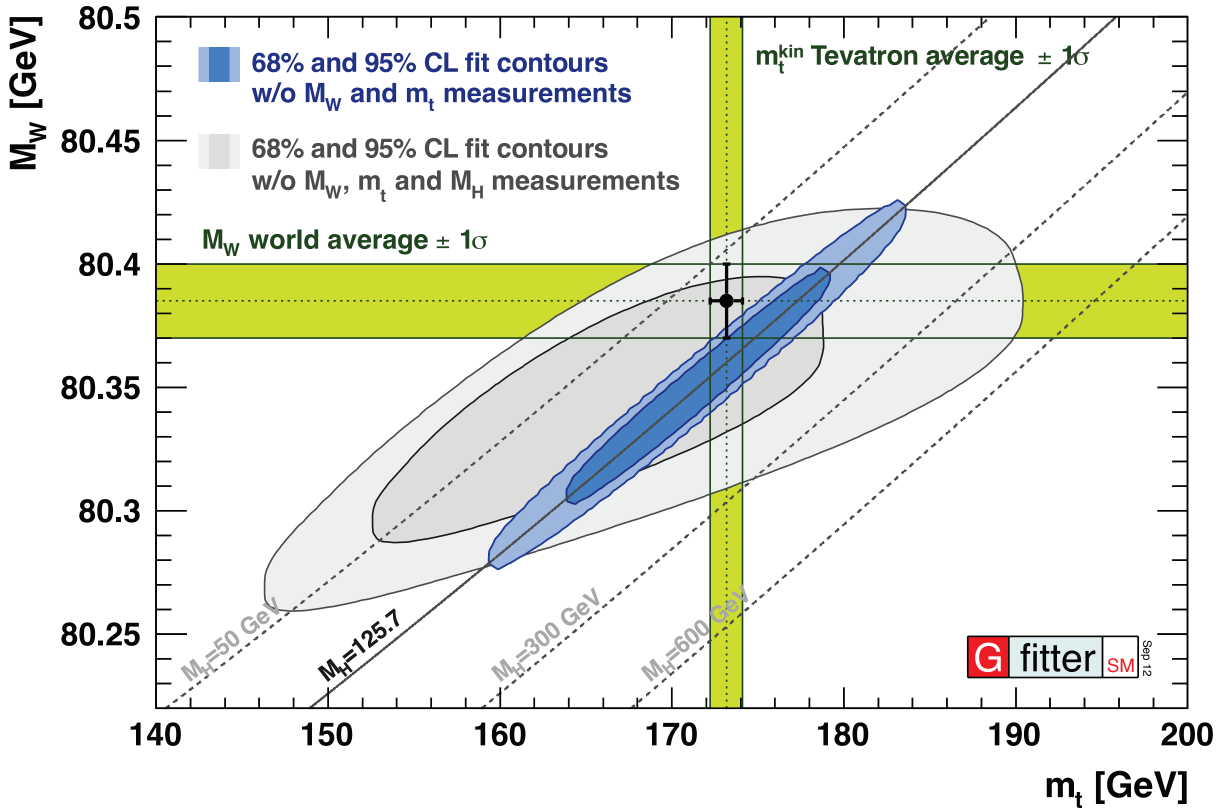
[Degrassi et al. 2012]

Status of the Standard Model



SM input now completey determined $\Rightarrow$ PO uniquely predicted

	theo	exp
$\sin^2\theta_{\rm eff}$	$0.23152 \pm 0.00005 \pm 0.00005$	0.23153 ± 0.00016
M_W (GeV)	$80.361 \pm 0.006 \pm 0.004$	80.385 ± 0.015



few observables with not-so-good agreement

- in general, SM is in overall agreement with data
- yet a few quantities prefer to stand a bit apart ($\sim 3\sigma$)
  - the forward-backward asymmetry for b quarks, $A_{\rm FB}^{b\bar{b}}$ at the Z peak
  - the anomalous magnetic moment of the muon
  - the forward-backward asymmetry for top quarks at the Tevatron, $p\bar{p} \to t\bar{t}$

no conclusive situation

The success of the Standard Model

- impressive confirmation by a huge data sample from low to high energies, no significant deviations
- quantum effects have been established at many σ
- perfect indirect and direct determination of the top quark
- now being repeated for the Higgs boson
- new particle around 126 GeV strong candidate for the Higgs boson
- if confirmed: Standard Model closed

Happy End of a successful story ?

Shortcomings of SM

- no mass terms for neutrinos [introduce ν_R ...]

- hierarchy problem $v \ll M_{\rm Pl}, \quad M_H \ll M_{\rm Pl}$
- large number of free parameters $g_1,\, g_2,\, v,\, m_f,\, V_{\rm CKM}$
- no further unification of forces
- missing link to gravity

- nature of dark matter?
- baryon asymmetry of the universe?

- next steps with upgraded LHC
  – confirm the Higgs boson properties
  – check versus electroweak precision measurements
  – or find deviations, new structures:
    - more Higgs bosons (doublets, singlet, ..)
    - supersymmetry (minimal or non-minimal)
    - new strong sector, substructure
    - . . .
