Why ElectroWeak corrections to $t\bar{t}H$ production?

Precise calculations are important (if you are at the MIAPP, you know it)

EW corrections had been calculated for the main Higgs production channels at the LHC, with the exception of $t\bar{t}H$ production.

Why Weak corrections to $t\bar{t}H$ production?

We calculated NLO corrections of mixed QCD-Weak origin, ignoring QED effects. We compared them to NLO QCD corrections.

Why Weak corrections to $t\bar{t}H$ production?

We calculated NLO corrections of mixed QCD-Weak origin, ignoring QED effects. We compared them to NLO QCD corrections.

Phenomenology motivations

Electroweak corrections are in general small. However, Sudakov logarithms can enhance their size. They originate only from Weak corrections

The cross section of $t\bar{t}H$ depends directly on $\lambda_{t\bar{t}H}^2$. At NLO, only Weak corrections introduce a dependence on other Higgs couplings.

CONCLUSIONS

The automation of mixed EW+QCD corrections in $MadGraph5_aMC@NLO$ is in progress. The first pheno study has been presented for $t\bar{t}H$ production.

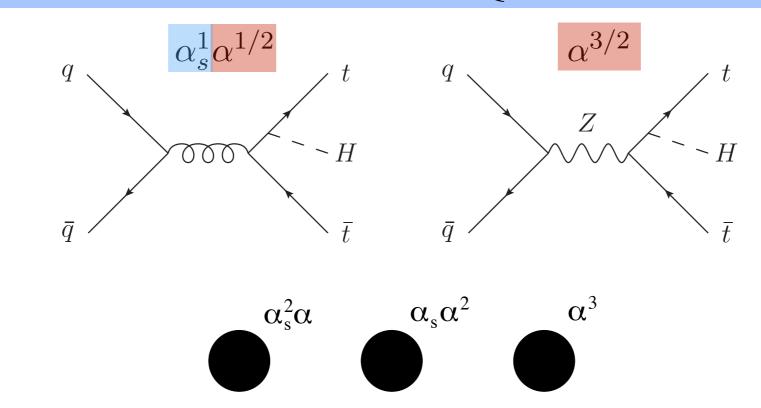

NLO Weak corrections are not negligible, especially in the distributions for large pt and in the total cross sections for boosted top quarks and Higgs boson.

Negative contributions from Sudakov logs are partially compensated by the real radiation of heavy bosons (HBR).

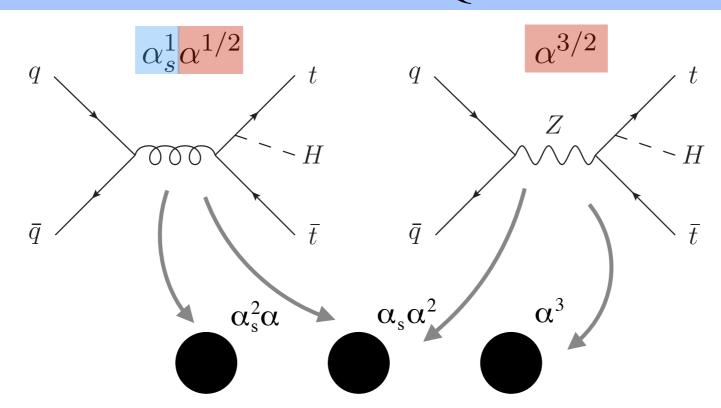

OUTLOOK

- Complete the automation of EW+QCD corrections.
- Calculate NLO QED corrections to ttH production.
