

Status of VXDTF-related modules

R. Frühwirth, J. Lettenbichler, T. Madlener

Institute of High Energy Physics
Austrian Academy of Sciences

April 21, 2015

What happened since last F2F meeting (Jan 2015)?

Been there, done that:

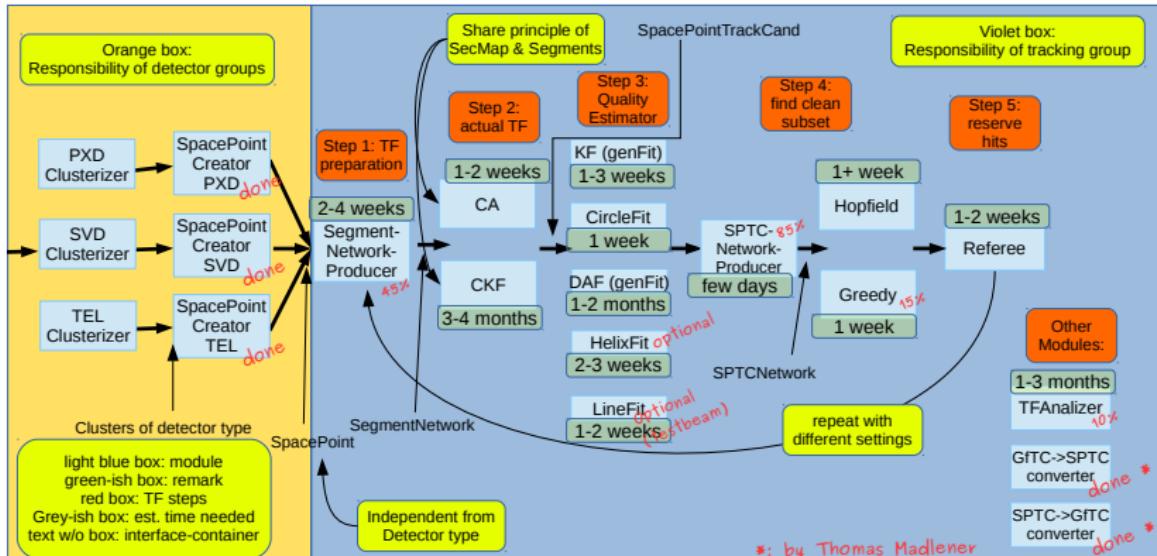

- Continued working on observers (segFinder)
- Refactoring FilterCalculator (using SPs, some tweaks, not in repository)
- Study of $\theta 90^\circ$ -issue (cause finally found and fixed, thanks to Martin Ritter and Peter Kvasnicka!)
- Bugfixes (as always)
- SPTCNetworkProducer- + TrackSetEvaluatorGreedyModule (started)

slide from last F2F meeting in Prague January 2015

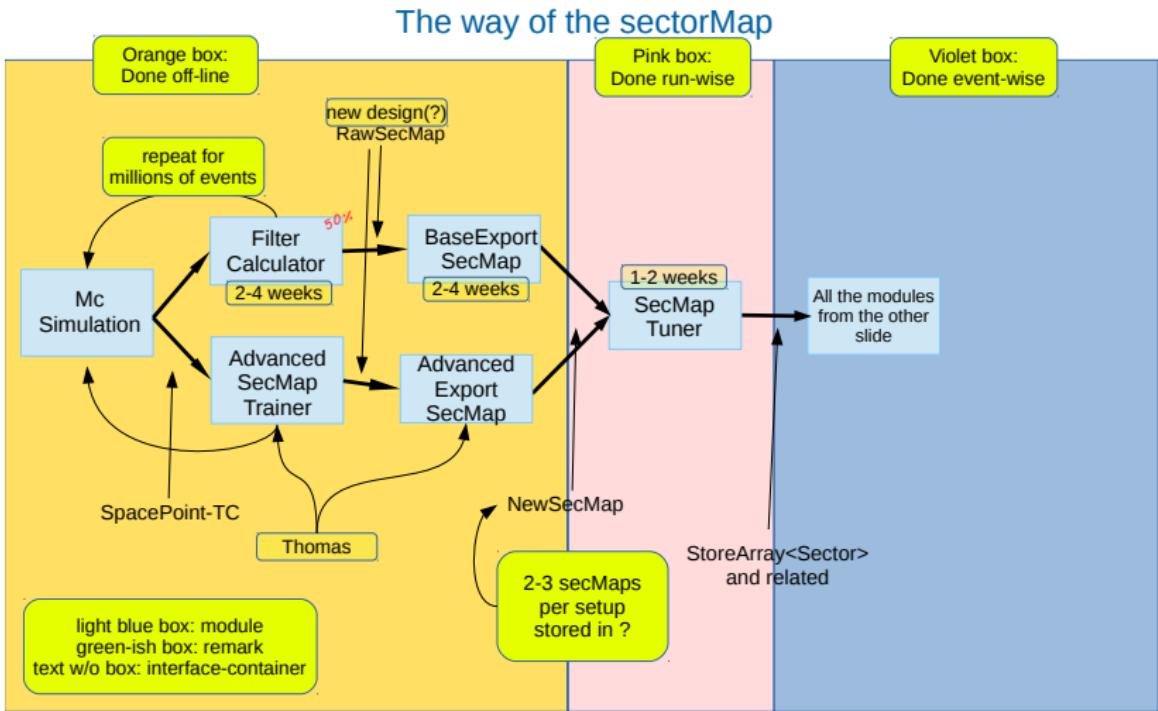

Next proposed steps - ordered (time planned):

- Quick and dirty efficiency-finetuning for connecting the dots-conference (?) (1-3 week)
 - Converting VXDTF-, TFRedesign- and FilterCalculatorModule to SpacePoints (should then easily be migrated to tracknodes of segmentNetwork)
- Finishing Observer-stuff (1-2 weeks) done (2-hit-filters, no TFanalyzer connection, got more complicated)
- Starting to use new sectorMap-container → to be coordinated with Eugenio
- Migrating to segmentNetwork, finishing its module
- Implementing SelectionVariables for nbFinder and others
- Migrating modules: CA, Hopfield, KF(genfit-pipe), CF, Greedy, Referee (simple version) got more complicated, cont'd, but mostly solved by now
- Connecting the modules, make sure everything works
- Expected milestone to be reached: end of April fortunately, no year mentioned...

Future state of the trackFinderVXD-approach (event-part)

- done, but not directly listed above: observers (2-hit), B3Vector3, Filters
- estimated time needed for essential stuff: 8-15 months, redesign only: 4-9 months
- not mentioned here: IntelligentSpacePointCreatorSVD → Andrzej Bozek (or someone delegated by him, current status unknown)

Test setup

Setup A

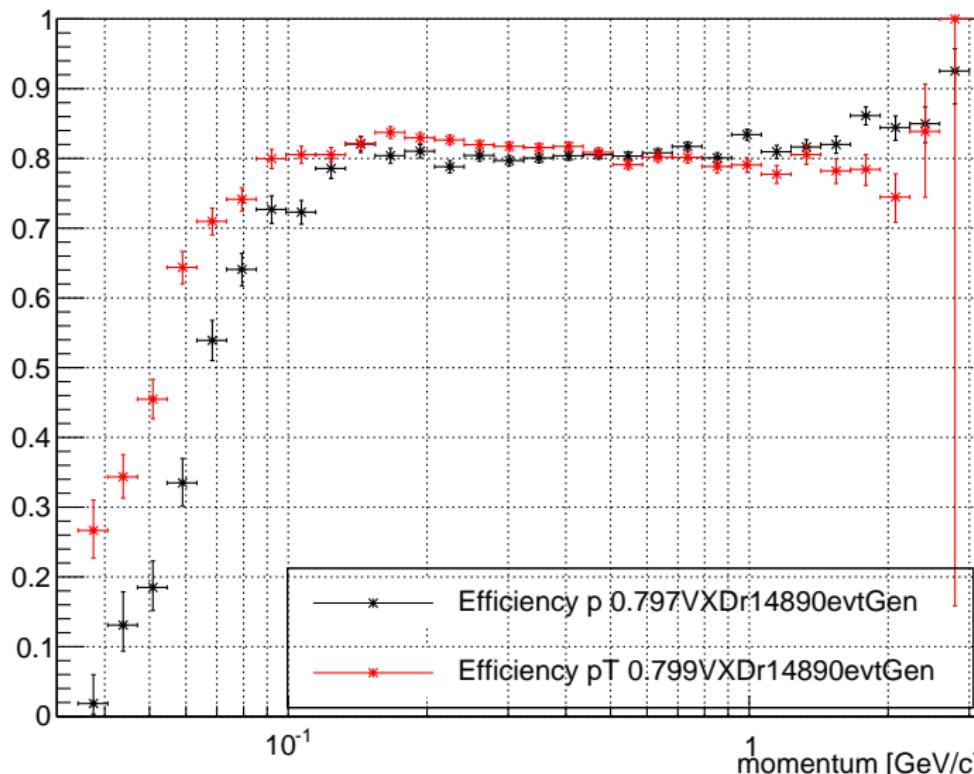

- 5000 evtGen-standard-events
- beam pipe, PXD, SVD, magnetic field cut off at $r = 15\text{ cm}$
- VXD and SVD runs (marked as such)
- no extra background added

Setup B

- 5000 events with 10 tracks of one particle type (marked as such)
- beam pipe, PXD, SVD, magnetic field cut off at $r = 15\text{ cm}$
- VXD runs only
- no extra background added

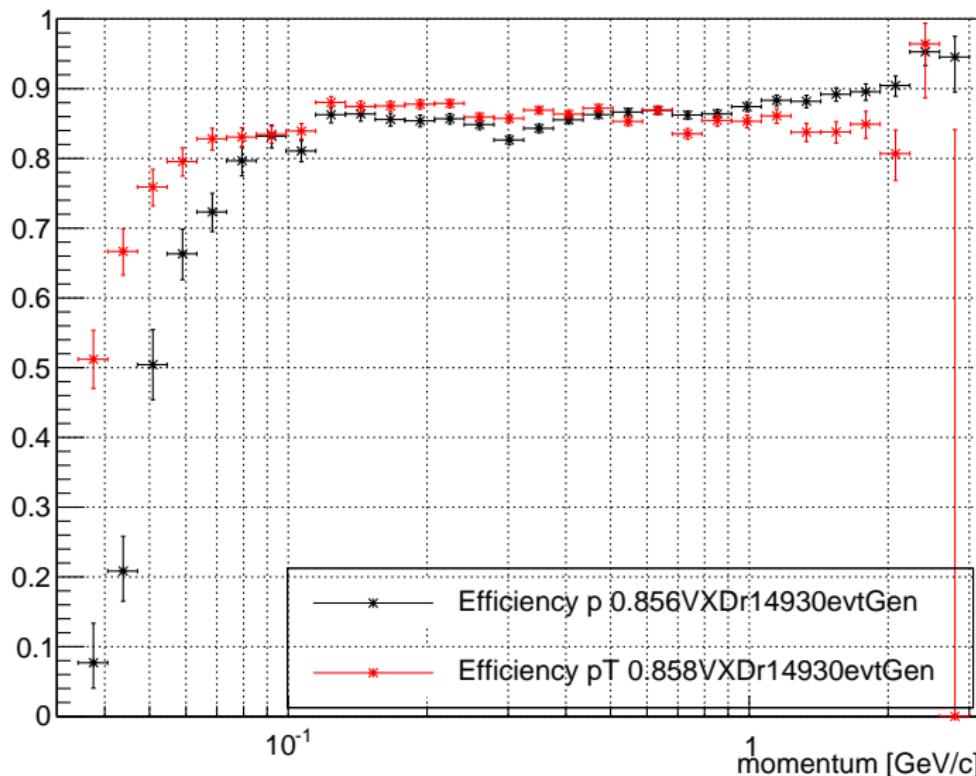

Setup A - r14890 - evtGen no BG VXD

Efficiency vs momentum

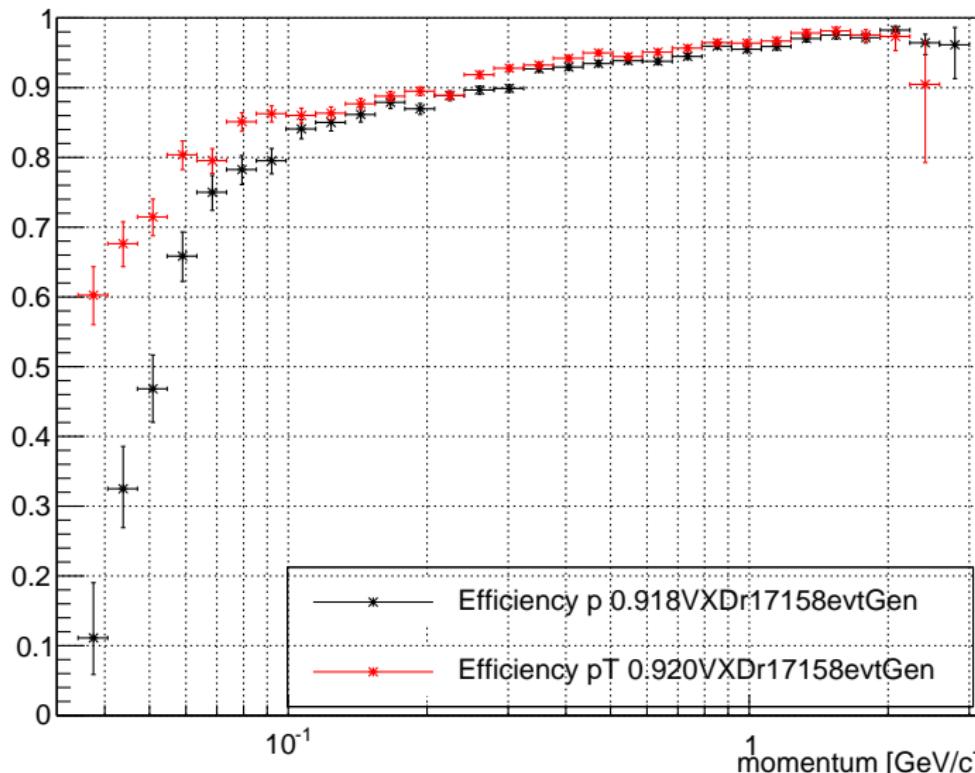

Setup A - r14930 - evtGen no BG VXD

Efficiency vs momentum

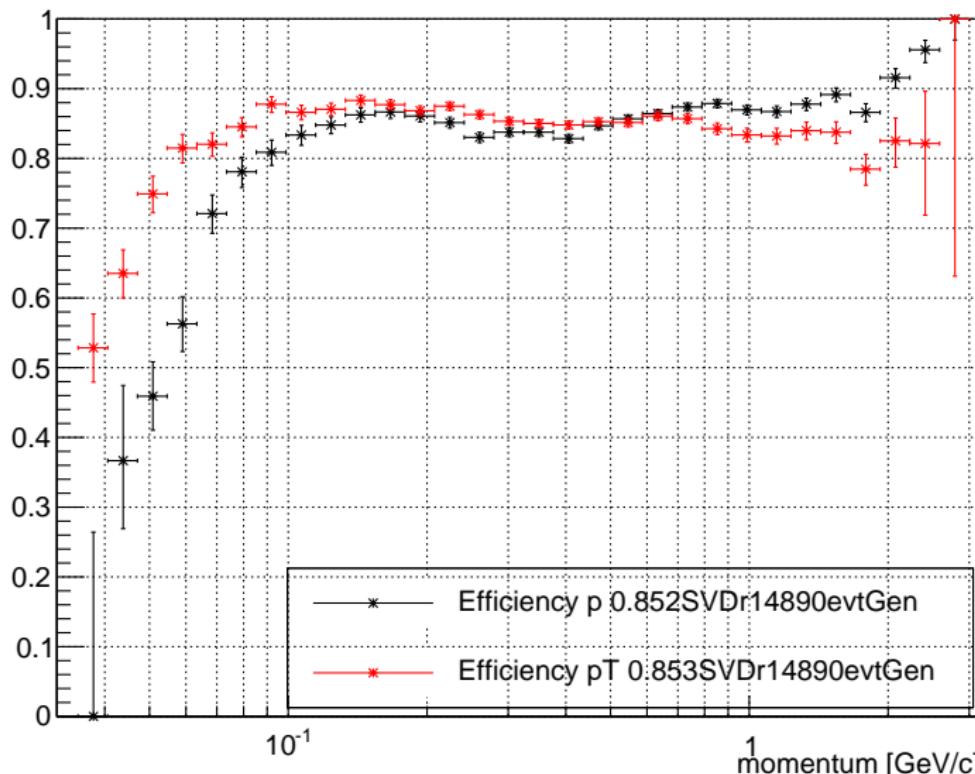

Setup A - r17158 - evtGen no BG VXD

Efficiency vs momentum

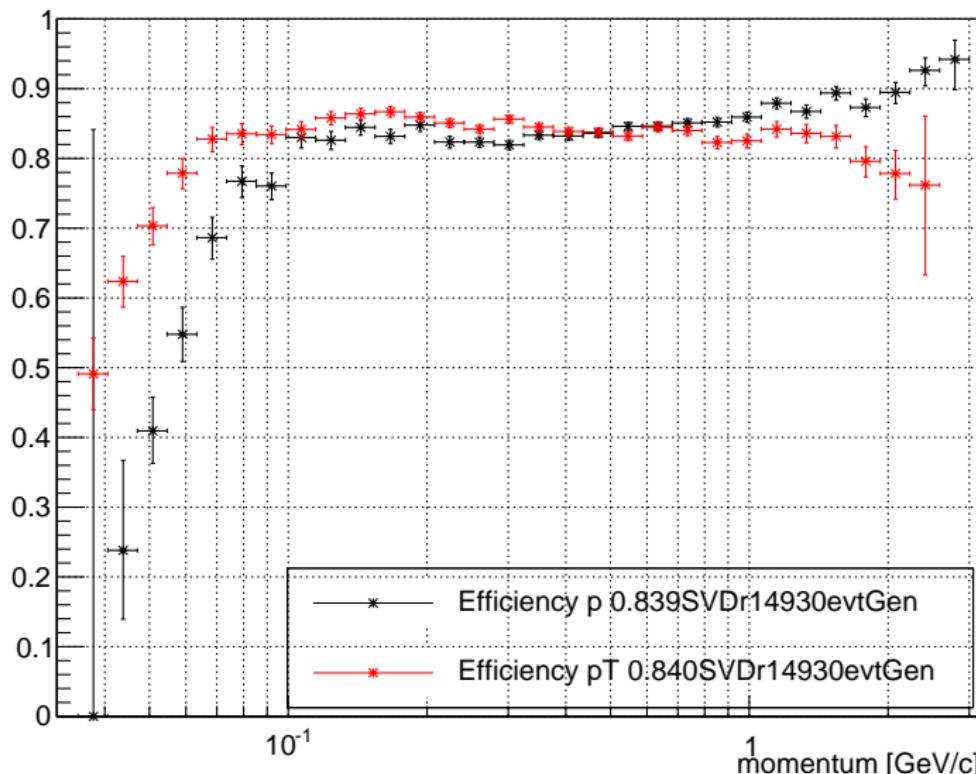

Setup A - r14890 - evtGen no BG SVD

Efficiency vs momentum

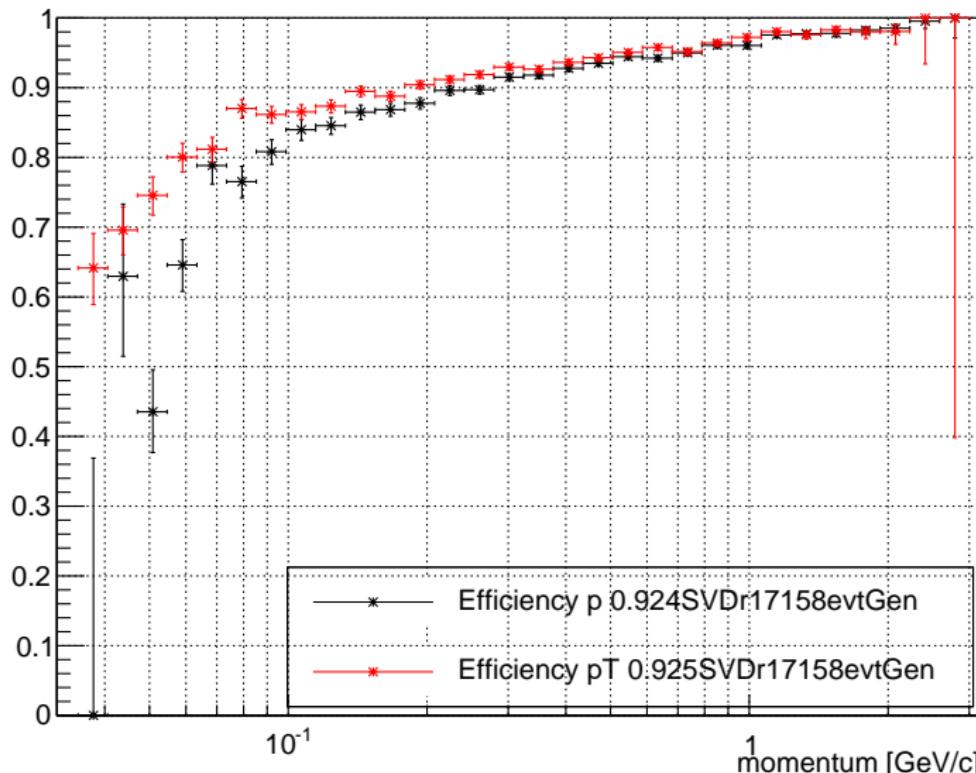

Setup A - r14930 - evtGen no BG SVD

Efficiency vs momentum

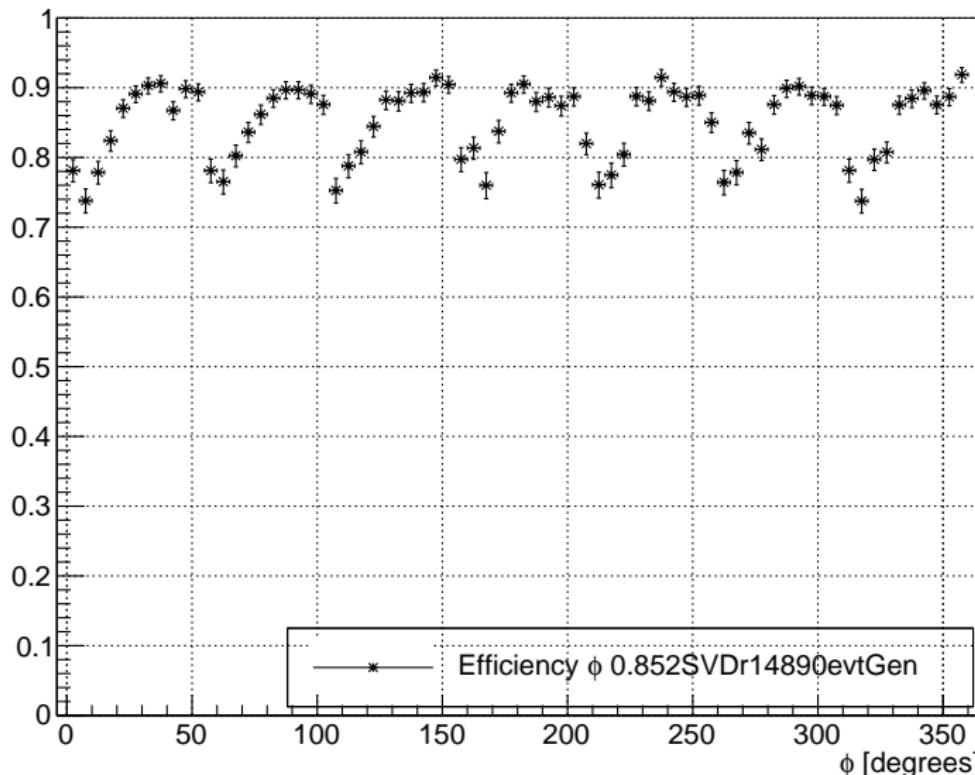

Setup A - r17158 - evtGen no BG SVD

Efficiency vs momentum

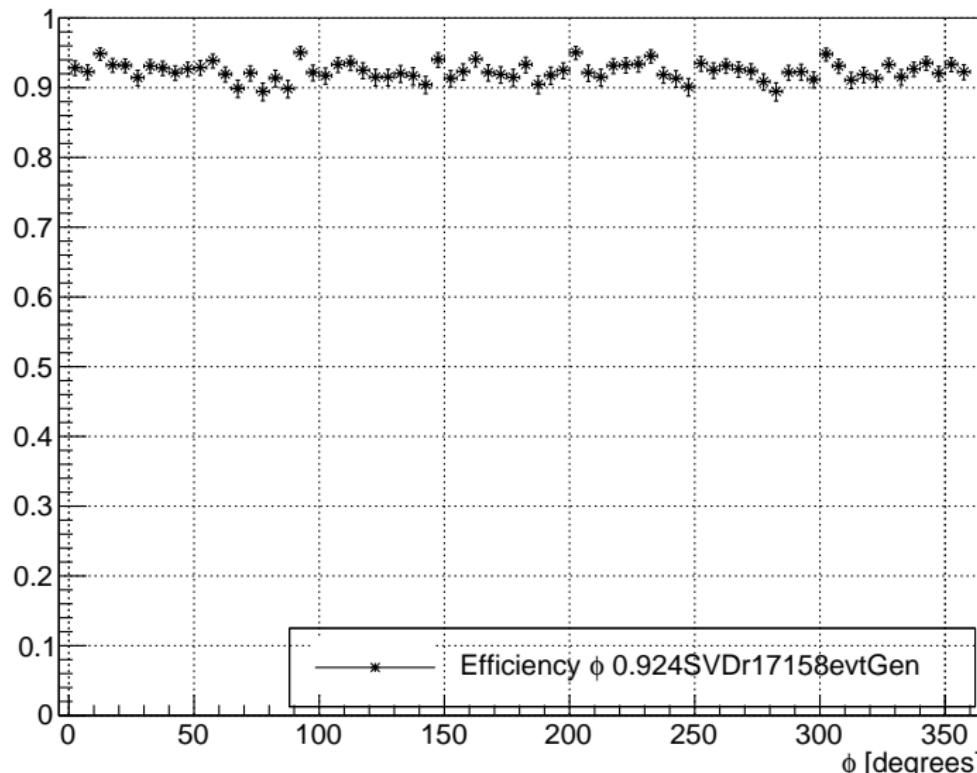

Setup A - r14890 - evtGen no BG SVD

Efficiency of ϕ

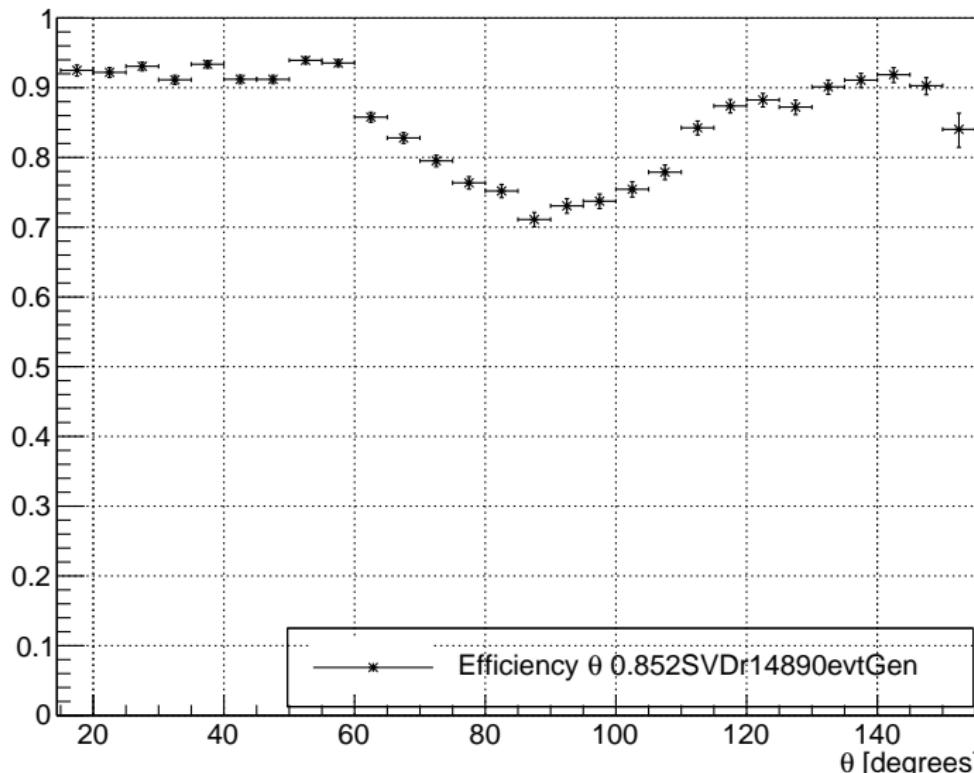

Setup A - r17158 - evtGen no BG SVD

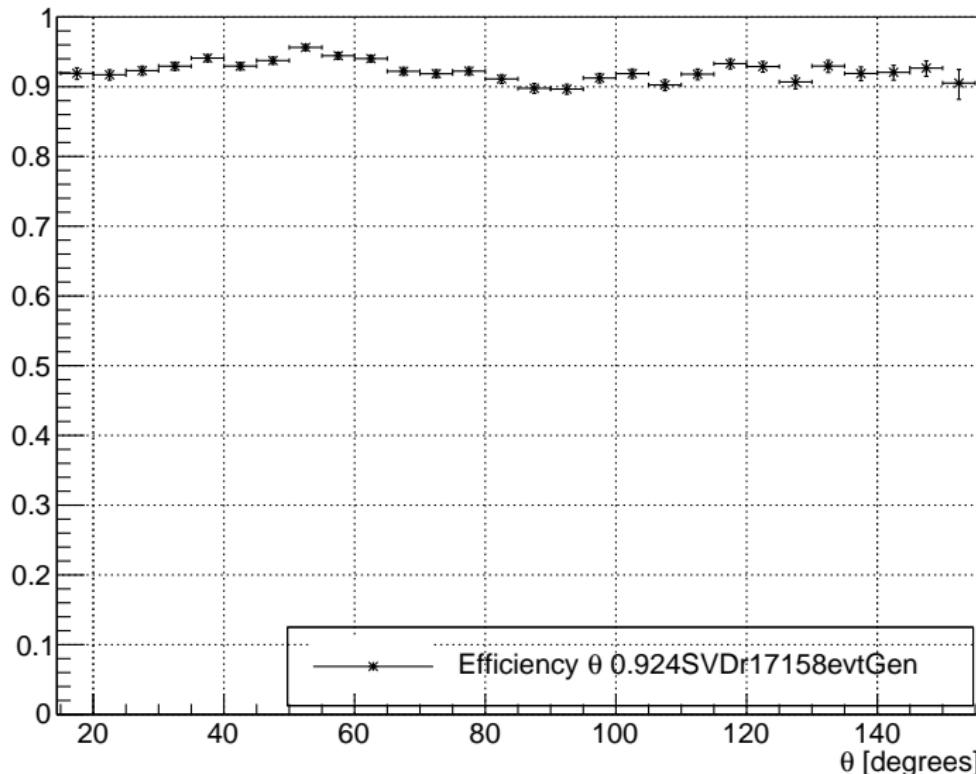

Efficiency of ϕ 

Setup A - r14890 - evtGen no BG SVD

Efficiency of θ

Setup A - r17158 - evtGen no BG SVD

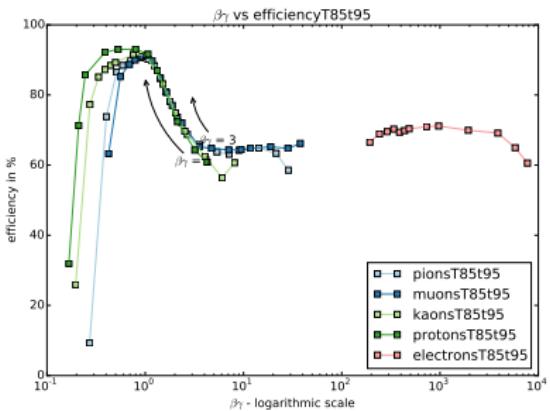

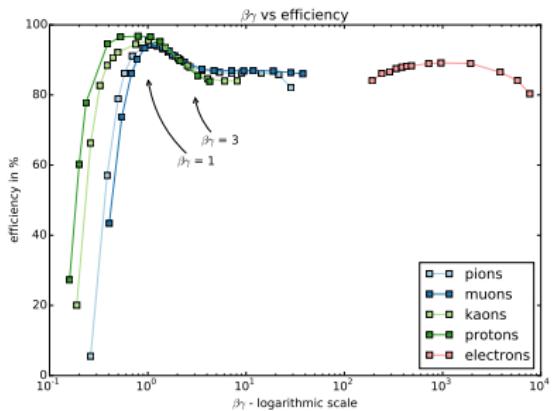

Efficiency of θ 

Setup A overview

Table : comparing the results

| Revision | hitRatioPXD | hitRatioSVD | Efficiency | Ghost |
|-----------|-------------|-------------|------------|-------|
| r14890SVD | x | 84.9% | 85.18% | 6.47% |
| r14890VXD | 19.7% | 81.5% | 79.62% | 5.4% |
| r14930SVD | x | 83.5% | 83.89% | 5.84% |
| r14930VXD | 78.9% | 81.9% | 85.52% | 6.32% |
| r17158SVD | x | 91.6% | 92.4% | 6.26% |
| r17158VXD | 85.4% | 87.8% | 91.75% | 6.12% |

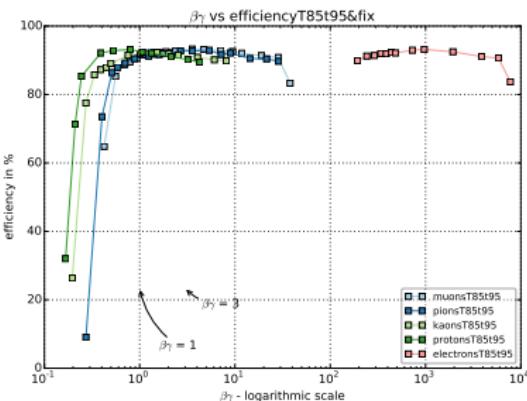

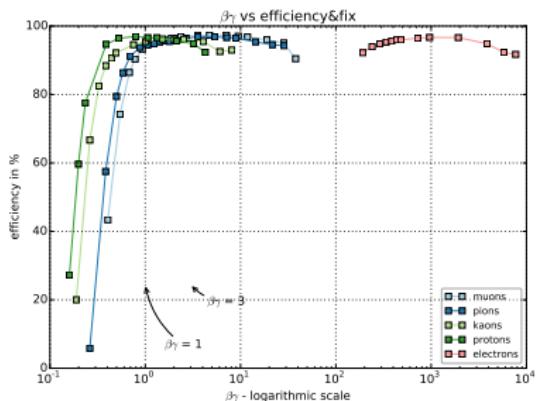

Setup B - $\beta\gamma$ vs efficiency (before fix)

$\beta\gamma$ vs efficiency - full $\theta 12^\circ - 152^\circ$

$\beta\gamma$ vs efficiency - $\theta 85^\circ - 95^\circ$

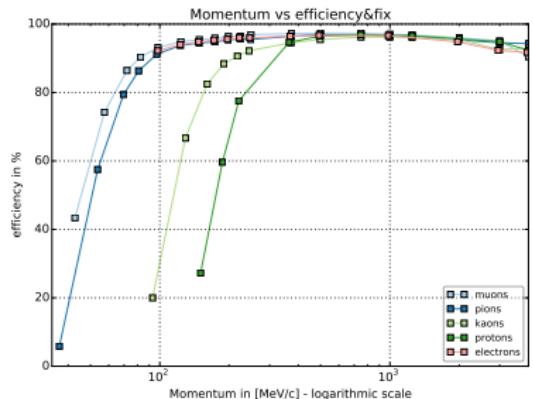

Setup B - $\beta\gamma$ vs efficiency - fix

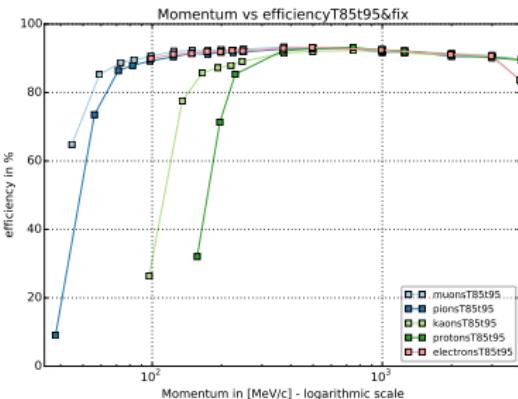

$\beta\gamma$ vs efficiency - full $\theta 12^\circ - 152^\circ$

$\beta\gamma$ vs efficiency - $\theta 85^\circ - 95^\circ$ using Peters fix

Setup B - momentum vs efficiency - fix

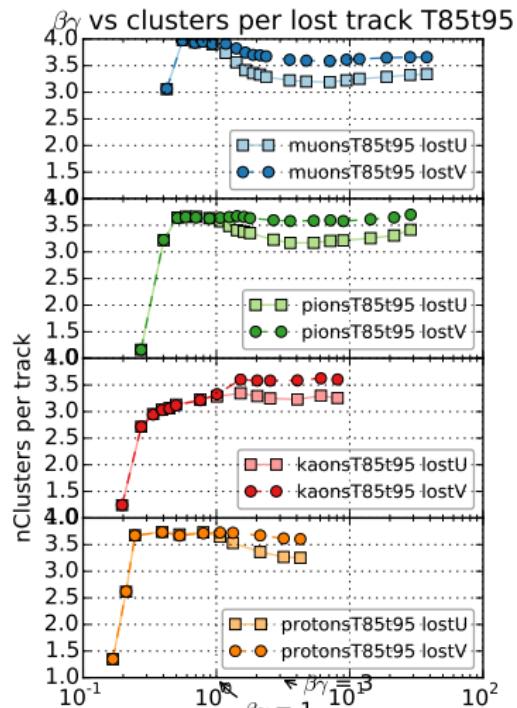

momentum vs efficiency - full θ $12^\circ - 152^\circ$

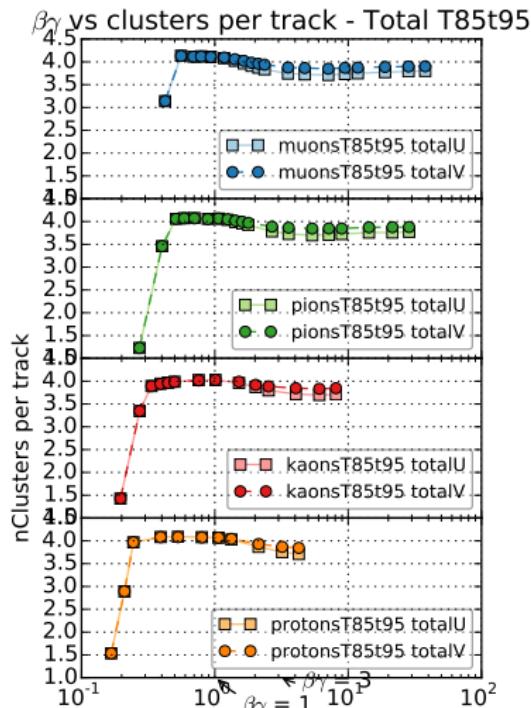

momentum vs efficiency - θ $85^\circ - 95^\circ$ using Peters fix

Setup B - $\beta\gamma$ vs clusters (lost) tracks (before fix)

$\beta\gamma$ vs clusters in lost tracks (left), $\theta 85^\circ - 95^\circ$

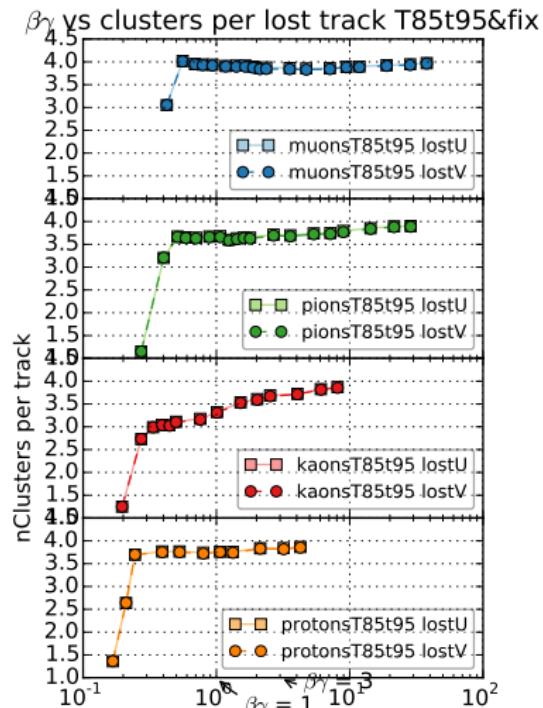

$\beta\gamma$ vs clusters in all tracks (right), $\theta 85^\circ - 95^\circ$

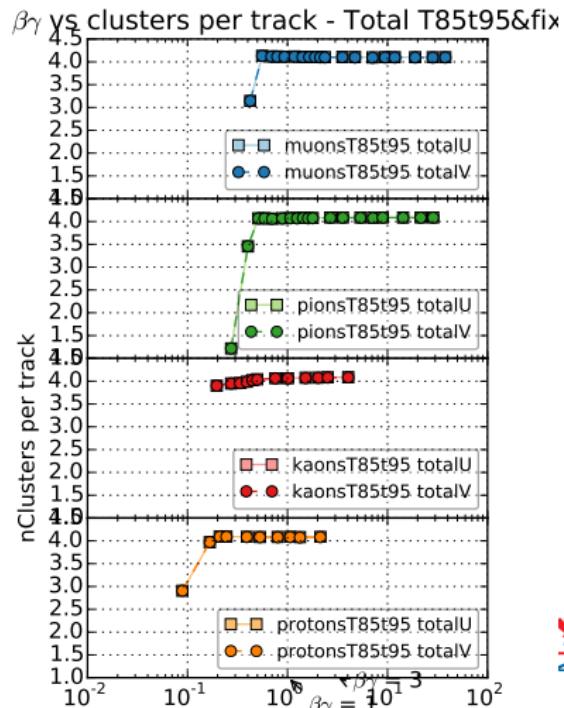

Setup B - $\beta\gamma$ vs clusters (lost) tracks - fix

$\beta\gamma$ vs clusters in lost tracks (left), $\theta 85^\circ - 95^\circ$

$\beta\gamma$ vs clusters in all tracks (right), $\theta 85^\circ - 95^\circ$

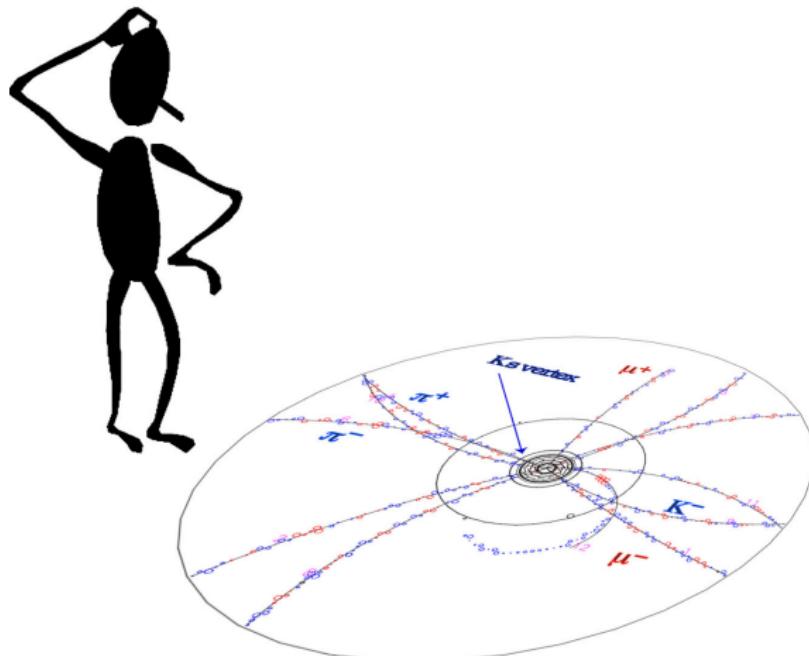

Next proposed steps - order of implementation:

- SPTCNetworkProducer
- TrackSetEvaluatorGreedy
- TrackSetEvaluatorHopfield
- if secMap not ready yet:
 - QualityEstimatorCircleFit
 - SpacePointReferee
- FilterCalculator/SecMapTrainerBase
- ExportSecMap/RawSecMapMerger
- SectorMapTuner
- SegmentNetworkProducer
- TrackFinderVXDCellMat
- TrackFinderVXDComboKalFit
- QualityEstimatorKalmanFilter
- QualityEstimatorDAF
- TrackFinderVXDAnalizer, after finishing TrackSetEvaluatorModules
mixed all in between

that's all, folks!

Any suggestions, ideas or requests?

Jakob.Lettenbichler@oeaw.ac.at

FilterCalculator - 50% done

- add newFilters, remaster as much as possible without breaking the interface
- fork, newModule: SecMapTrainerBase
- change to support for new secMap
- estimation: 2-4 weeks

ExportSecMap - 0% done

- fork newModule: RawSecMapMerge
- implement new secMap-design (2- & 3-hit maps)
- merge raw files
- take care of RAM-consumption (depending on Thomas Madlener's future plans and design of secMap)
- estimation: 2-4 weeks

SectorMapTuner - runOnly 0% done

- load static secMap from root file
- apply tuning parameters
- make the map accessible on StoreArray
- estimation: 1-2 weeks

SpacePointCreatorSVD - 100% done

- SVDClusters (or combinations of it) → SpacePoints

IntelligentSpacePointCreatorSVD - 0% done ?

- responsibility of Andrzej Bozek, Job: combine clusters intelligently
- estimation: 2-4 months

SpacePointCreatorPXD - 100% done

- PXDClusters → SpacePoints

SpacePointCreatorTEL - 100% done

- TelClusters → SpacePoints

SegmentNetworkProducer - 45% done

- access secMap on StoreArray
- add virtual interaction point and find sectors for given SpacePoints → if found: trackNodes ↔ spacePoints
- find compatible sectors
- apply segFinder-Filters → segments connecting trackNodes
- apply nbFinder-Filters → friends connecting segments
- store segmentNetwork to StoreArray
- estimation: 2-4 weeks

TrackFinderVXDCelloMat - 0% done

- encapsulate old algorithm
- load segmentNetwork
- apply cellular automaton on network (interface to be designed)
- collect TCs as SpacePointTrackCards
- calculate seed and store SPTCs on StoreArray
- estimation: 1-2 weeks

TrackFinderVXDComboKalFit - 0% done

- load segmentNetwork from storeArray
- for each allowed treeSeed, extrapolate to each sensor allowed by sectorCombi
- collect x (parameter, $1 \leq x \leq 5$) best fits and store for further extrapolations
- final trees of trackCands: store best y (parameter, $1 \leq y \leq 5$) TCs of single trees
- on-the-fly (genfitTrackCand)seed-parameter estimation
- estimation 3-4 months

QualityEstimatorCircleFit - 0% done

- convert interface from VXDTFTrackCandidates to SpacePointTrackCands
- estimation: 1 week

QualityEstimatorKalmanFilter - 0% done

- take TC and apply seed needed for fitting
- bad-ass-way: convert SpacePointTrackCards to genfit::TrackCand before, apply old interface
- estimation bad-ass: 1 week
- efficient-way: start with that module after finishing TrackFinderVXDComboKalFit, use as much as possible from that module
- estimation efficient: 1 week
- correct way: make genfit compatible (how?), new interface to be written
- estimation correct: 3+ weeks

QualityEstimatorStraightLine - 0% done

- take TC and apply seed needed for fitting
- needed for runs without magnetic field and for testbeams
- low priority (any volunteers?)
- estimation: 1-2 weeks

QualityEstimatorHelixFit - 0% done

- take TC and apply seed needed for fitting
- code partially already in FW, question whether should be completed
- lowPriority (any volunteers?)
- stimation: 2-3 weeks

QualityEstimatorDAF - 0% done

- take tree of TCs and determine the best one using DAF
- mostly piping into genfit
- open question is how to do the interface (synergies with TrackFinderVXDComboKalFit and QualityEstimatorKalmanFilter apparent)
- estimation: 1-2 months

SPTCNetworkProducer - 85% done

- take all given SpacePointTrackCards and weave into network of SpacePointTrackCards \leftrightarrow nodes/SPTCAvatar
- connect nodes when TCs are overlapping \leftrightarrow links/TCCOMPETITORS
- overlapping: Cluster-wise or SP-wise, parameter choice
- prepare for fast acces and state-update (needed for TrackSetEvaluatorXY-Modules)
- not fully clear what happens for several passes (update or recreate network?)
- estimation: < 1 week (already working, but some changes during implementation of TrackSetEvaluatorXY-modules probable)

TrackSetEvaluatorGreedy - 15% done

- load SPTCNewtork
- sort by QI, apply-Greedy algorithm (new interface needed)
- new storeArray with non-overlapping TCs only (or simply kill bad TCs and leave them rotting in their storeArray)
- estimation: 1 week

TrackSetEvaluatorHopfield - 0% done

- load SPTCNewtork
- apply Hopfield Neural network algorithm (new interface needed)
- fill or kill SPTCs like Greedy
- estimation: 1+ week

SpacePointReferee - 0% done

- best x% (parameter) of TCs reserve the SP/Clusters (parameter) for further iterations
- not completely clear how to store relevant info (not thought about that yet in detail)
- estimation 1-2 weeks

SPTC2GFTCCConverter - 100% done

- Written and maintained by Thomas Madlener

GFTC2SPTCCConverter - 100% done

- Written and maintained by Thomas Madlener

TFAnalyzer - 10% done

- fork, newModule: TrackFinderVXDAnalyzer
- analysis module compatible with new design
- collect data from modules and store specific info to root files (eg efficiency vs pT, acceptance rate of dist3D for good combis...)
- correct implementation:
 - heavily depending on observers, design only fixed yet for seg- and nbFinder (== segmentNetworkModule). completely unclear for everything else
 - problem of correctly linking data in an oo-way for not to lose info too early
- actual implementation: on-the fly, minimal effort, only when needed
- estimation: difficult, since many unsolved questions, 1-3 months

The redesign task-force

Who participates actively

- Eugenio Paoloni: the sectorMap-*Creator* (design for interfaces, off-line and on-line)
- Thomas Madlener: personal coach for the sectorMaps (training of the cuts, choosing sector size, filter types, pT-cuts, ...)
- Rudolf Frühwirth: father of the trackFinder (TF concept is his initial idea, now consulting task)
- Martin Heck: convener (mainly consulting tasks)
- Jakob Lettenbichler: midwife of the TF (responsible for the rest)

Setup A - r14890 - evtGen no BG SVD

Time consumption of each relevant part of the TF - normalized to 1 = median (median vs mean)
