## $X/X_0$ imaging of Belle II modules

#### Ulf Stolzenberg for the test beam team

#### University of Göttingen, II. Physikalisches Institut

#### January 14th 2016, 9th VXD Belle II Workshop

Image: A math a math

Ulf Stolzenberg for the test beam team  $X/X_0$  imaging of Belle II modules

#### Conclusion

## Measurements of SVD and PXD modules

#### Motivation

- Low material budget is an essential part of the belle II ladder development especially for PXD part
- $\bullet\,$  Mean material budget of PXD ladder  $\approx$  0.1-0.2 %
- Small regions (i.e. bump bonds and capacitances) of highly increased material (worst case: 1%)
- Long term goal: Find out if tracking can be improved by using more detailed/accurate detector model based on X/X<sub>0</sub> measurements

#### Results in this talk

- $X/X_0$  Imaging of area near APV25 chips and cooling pipe
- $X/X_0$  Imaging of balcony, switchers and passives on the DEPFET modules

Ulf Stolzenberg for the test beam team

Image: A match a ma

## Overview of $X/X_0$ data

#### DESY test beam campaign in november 2015

- $X/X_0$  measurements on two Belle II modules
- Large statistics at beam energy of 4 GeV

#### **DEPFET Dummy Module**

- Including a switcher and 4 capacitors in measurement region
- $\bullet\,$  Total of  $\approx\,108\,$  mio tracks
- calibration for this data-set: 14 mio tracks

#### SVD Origami module

- 3 different measurement regions
- cooling pipe, APV25 chips etc visible
- Total of  $\approx 26+98+29$  mio tracks

• • • • • • • • • • • •

## $X/X_0$ Measurements

#### Basic idea

Reconstruct kink angle distributions on central plane  $\rightarrow$  width of distribution depends on  $X/X_0$ .

#### Definition of $\lambda$

- Finite angle resolution on target plane  $\rightarrow$  gaussian with standard deviation of  $\sigma_{\rm err}$  as resolution function on target
- Expected value  $\sigma_{\rm err}$  is affected by systematical errors (slightly wrong m26 resolution, additional multiple scattering within telescope, etc)
- Introduce  $\lambda$  factor: calibrated angle reconstruction error  $\sigma^*_{
  m err} = \lambda \cdot \sigma_{
  m err}$ ,  $\lambda$  should be close to 1.0

## $X/X_0$ Measurements

First step: Calibration on metal grid with appropriate MSC model

• Reconstructed multiple scattering angle distribution given by

$$f_{\rm reco} = f_{\rm MSC}\left(\theta\right) * \frac{1}{\lambda \,\sigma_{\rm err} \,\sqrt{2\pi}} \exp\left(-\frac{1}{2} \left(\frac{\theta}{\lambda \,\sigma_{\rm err}}\right)^2\right)$$

- $\bullet~{\it f}_{\rm MSC}$  depends on many material and particle beam parameters
- Target with well known material profile allows  $\lambda$  calibration
- Find  $\lambda$  by simultaneous fit of reconstructed angle distributions

#### Second step: Measurement on materials

• Use optimal calibration factor in other  $X/X_0$  measurements

## Setup of telescope for SVD $X_0$ measurements

- EUDET telescope with 6 M26 planes (3 µm resolution per plane)
- Spacings chosen like this to keep the angle reco error  $\sigma_{\rm err}$  small

Image: A mathematical states and a mathem

## Setup of telescope for SVD $X_0$ measurements

- EUDET telescope with 6 M26 planes (3 μm resolution per plane)
- Spacings chosen like this to keep the angle reco error  $\sigma_{\rm err}$  small

Image: Image:

Ulf Stolzenberg for the test beam team

## Setup of telescope for SVD $X_0$ measurements

- EUDET telescope with 6 M26 planes (3 µm resolution per plane)
- Spacings chosen like this to keep the angle reco error  $\sigma_{\rm err}$  small
- Measurements on 3x3 calibration metal grid and SVD Origami module

Image: A matrix and a matrix

## Selection of measurement areas for calibration

Ulf Stolzenberg for the test beam team

University of Göttingen

 $X/X_0$  imaging of Belle II modules

## SVD Calibration @ 4 GeV (HL model)

#### Calibration results SVD

- Simultaneous fit of 12 multiple scattering angle distributions
- Fit results:  $\lambda = 1.171 \pm 0.003$

Image: A match a ma

Ulf Stolzenberg for the test beam team

## SVD Calibration @ 4 GeV (HL model)

#### Calibration results SVD

- Simultaneous fit of 12 multiple scattering angle distributions
- Fit results:  $\lambda = 1.171 \pm 0.003$
- rather large value  $(\lambda \approx 1.1 \text{ typical value} \ \text{at DESY})$

#### Fitted kink angle distributions

Image: Image:

## Measurement of structures on the PXD

![](_page_35_Figure_7.jpeg)

 $X/X_0$  peaks at the edges for the large capacity as well. The radiation length of the capacity itself is approx. 2.3 - 2.4 %

Ulf Stolzenberg for the test beam team  $X/X_0$  imaging of Belle II modules

## Conclusion and Outlook

#### Conclusion

- X/X<sub>0</sub> measurements on SVD and PXD modules mostly consistent with expected material budget
- Still large systematical effects, indicated by large calibration factor λ, main issues: (Target-) Alignment, especially z-alignment, M26 digital effects
- In the PXD case: Statistics large enough (more than 100 mio tracks) for 30  $\mu m^2$  pixels in  $X_0$  image

Ulf Stolzenberg for the test beam team

## Conclusion and Outlook

#### Outlook

- Simulation studies of target misalignment
- Comparison between the currently employed detector model and a more detailed one with respect to tracking → What is the effect on the tracking procedure, when averaging the material budget of small structures? Is this effect relevant?

Ulf Stolzenberg for the test beam team
