

PXD Permanent Set Up Schedule

Schedule

Schedule

Alternative Schedule

Manpower and Equipment

Target: 2 complete ladders (4 modules)

- Modules (HLL)
- DHH system and PC (TUM)
- ONSSEN (GIE)
- Fibres ONSSEN-DHH (GIE)
- Fibers DATCON-ONSSEN (BN)
- Power supplies. Power cables. Patch panels (LMU)
- Laser. Radioactive sources (DESY)
- Network switch. Slow control server (DESY+HEI)
- Data cables (MPP+BN)
- DATCON (BN)
- Mechanics (MPP+DESY)

Manpower: To be discussed

Open Questions

- Core weeks: 2 weeks after BPAC, for connecting and making the system robust and easy to be operated by shifters
- If TOP/CDC/VXD/ECL/roll in delayed, we should consider (if allowed by the DESY schedule) moving the VXD test beam to January
 - One entire month for lab operation
 - Start the test beam with PXD only in December
- Idea to have a 24/7 running system, remote access possible
- AIDA funding available for test beam (only!)
 - European Project Leader
 - 3-5 European Scientists
 - Up to 3 Japanese Scientist
- Could you provide us a detailed plan for testing (when, what do you need, for how long?)
 - PXD and SVD DAQ and Slow Control
 - Alignment and tracking
- Interference with cabling/piping at KEK

- RC/PSC
 - DHH only
 - 1 DHH
 - Christian Pulvermacher, PXD DAQ experts
 - 1 day during 1st week of October?
 - DHH+PS — PXD DAQ experts
 - 1 DHH + 1 PS connected to the same module
 - early to make this the default startupoption?
 - ONSSEN ⇒ Björn Spruck
 - DATCON ⇒ Björn Spruck
 - Inclusion into global RC/PSC
 - KEK DAQ experts
 - after start of data-taking?
- DQM-feedback to operator
 - needs EVB + running DQM
 - not before coding is finished...
- Alarm System
 - no influence on other systems' schedules.
 - can be extended as new conditions appear

- IPMI ONSSEN – stress test
 - ATCA Shelf, Shelf Manager, IOC's
 - Needs: correctly configured network and shelf manager, IOC, PV archiver
 - As much boards as possible
 - Goal: Find performance issues in IOC, interferences with different IOC's and many boards, long term stability
 - Will (mostly) run parallel to other tests, only if problems are found I need exclusive access (esp for firmware upgrade)
 - No DAQ, no sensor, no DHH... is needed

- IPMI DATCON
 - MTCA Shelf, Shelf Manager, IOCs
 - Needs: correctly configured network and shelf manager, IOC, PV archiver
 - As much boards as possible
 - Check interferences with different IOCs (ONSEN), NAT MCH, long term stability
 - Will (mostly) run parallel to other tests, only if problems are found I need exclusive access (esp for firmware upgrade)

- ONSEN SC

- Stable firmware setup, including correctly behaving Pvs
- Firmware and epics in flash (autoboot)
- Correct network setup, local IOC on ONSEN boards, epics archiver
- Monitoring of data flow needs DHH, (pseudo) HLT, (pseudo) event builder
 - Maybe DATCON
- Detecting unusual states needs “injection” of errors, exclusive
 - Recovery from these states
- Can be broken down in several steps
- ... updated list (changes since last TB) of PVs and their expected value is still missing
- SC is mandatory for complete RC – otherwise RC cannot react on actual status

- RC
 - Needs ONSSEN SC to work or Ready and Abort conditions are unusable
 - RC running locally on ONSSEN board as part of SC is needed
 - DATCON RC
 - Here we need two signals (PV) from DATCON board, ready and abort
 - Apart from that, RC has been prepared already (same as ONSSEN)
 - 1st step: Local RC can be tested, but is kind of toy ...
 - 2nd step: local PXD RC (DATCON + ONSSEN)
 - 3rd step: global (NSM) RC
 - 4th step: global (NSM) RC with other systems, then data taking
 - Step 1-3 should be doable in 1-2 days. No need for DAQ or sensors running
 - 4 is the critical one and needs the full system

Proposal for DESY schedule, Autumn 2016, part 1

1. 01.09.2016, switch on the detectors
(laser, power supplies, pedestal scan w/ BonnDAQ)
ONSEN not required
2. solve trigger problems between SVD and PXD (latching?)
pizza- ONSSEN, no ROI selection, controlled remotely
3. EVB is required from the beginning, but HLT not
→ HLT emulator, always full frame ROI
4. when trigger problem is solved
→ get rid of all the „-1“ workarounds (unpacker, HLT, EVB2)
5. install optical link between DHP and DHE
6. solve mismatches between DHE and DHC
(76 MHz, wrong commands to DHP ?)
n.b. beamtime 04/2016 shows DHE–DHC mismatches even
after cable exchange (unstable link) → expect debugging
7. switch on HLT (not HLT emulator anymore)
8. implement simplified re-mapping on DHE
(intermediate data format, proposed by Florian at Seeon16)

Proposal for DESY schedule, Autumn 2016, part 2

9. get rid of the re-mapping workarounds (HLT, DATCON, unpacker)
10. investigate data errors from 04/2016, with NEW DQM
(e.g. why has DHC start frame sometimes \neq 20 bytes ?)
11. pizza-ONSEN, switch on ROI selection
12. fix open issues in HLT-ONSEN interface
 - HLT reject handling
 - HLT „sendAll“ bit \rightarrow events w/o ROI selection
requires timing debugging on ONSEN
13. include DATCON
(assume that new uTCA backplane was already tested in pre-tests)
14. only if enough time: move to cluster-based data format
 - (a) implement clustering algorithm on DHE
 - (b) change to new data format on DHC, ONSEN, basf2 unpacker
backward compatibility will be lost!
 - (c) new logic on ONSEN (accept out-of-ROI-inside-cluster-hits)
 - (d) needs basf2 „cluster DQM“

- Verification of stability DHPT \leftrightarrow DHE links @76MHz
- Operation of 2+2 half ladder detectors
- Final design of DHH carrier cards with optical interfaces
- Detector types : IF, IB, OF, OB
- Trigger rate tests
 - Average 7 kHz trigger rate (one ONSEN module)
 - 30 kHz in pulse mode within short intervals of few seconds ?
- Readout modes
 - Raw data (pedestal measurement)
 - Zero suppressed data
- Zero suppressed data format
 - Direct DHPT format
 - Intermediate remapping format
 - Remapping hits within each DHPT

Thanks
