- Muon induced neutron in high-Z materials:  
background for dark matter or  $(0\nu\beta\beta)$  experiment.
- Lead shielding system:  
commonly used by underground experiments.
- Gd-doped liquid scintillator detector:  
measure the muon induced neutron in lead.
- Cross check with Minidex (see Raphael Kneißl's talk).

- 1 Neutron detector introduction
- 2 Neutron detector along with Minidex
  - Neutron detector along with Minidex

# Neutron detector introduction

- 28.27 liters liquid scintillator doping with 0.5% gadolinium
- Quartz glass container with size of  $\Phi 30 \times 40$  cm
- Use pulse shape discrimination(PSD) and time coincidence to select neutron events from background.

# Neutron detector $\gamma/\mu$ energy calibration

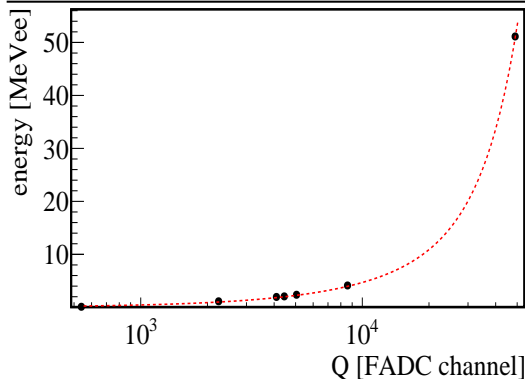

available  $\gamma/\mu$  energy calibration points

calibration source	$^{60}\text{Co}$	$\text{H}(\text{n},\gamma)\text{D}$	$^{228}\text{Th}$	AmBe	muon minimum ionization peak
energy(MeV)	1.17/1.33/2.5	2.2	2.6	4.4	50.98

# Neutron detector $\gamma/\mu$ energy calibration

available  $\gamma/\mu$  energy calibration points

calibration source	$^{60}\text{Co}$	$\text{H}(n,\gamma)\text{D}$	$^{228}\text{Th}$	AmBe	muon minimum ionization peak
energy(MeV)	1.17/1.33/2.5	2.2	2.6	4.4	50.98

energy calibration function:

$$y = ax^3 + bx^2 + cx + d$$

# Neutron detector background spectrum

- 1 Neutron detector introduction
- 2 Neutron detector along with Minidex
  - Neutron detector along with Minidex

# Selection process for muon induced neutron in lead

# Selection process for muon induced neutron in lead

- $\Delta t_{\mu\mu}$ : time difference between each two muon trackers

# Selection process for muon induced neutron in lead

- $\Delta t_{\mu\mu}$ : time difference between each two muon trackers
- $\Delta t_{n\mu}$ : time difference between prompt signal and muon trigger

# Selection process for muon induced neutron in lead

- $\Delta t_{\mu\mu}$ : time difference between each two muon trackers
- $\Delta t_{n\mu}$ : time difference between prompt signal and muon trigger
- $\Delta t_{\gamma n}$  time difference between prompt and delayed signal

# Spectra and $\Delta t_{\mu\mu}$ of muon trackers

# Spectra and $\Delta t_{\mu\mu}$ of muon trackers

## Require

- energy deposition  $> 6$  MeV for each muon tracker
- $\|\Delta t_{\mu\mu}\| < 30$  ns

# $\Delta t_{n\mu}$ and $\Delta t_{\gamma n}$ distribution

Require

$$40\text{ns} < \Delta t_{n\mu} < 200\text{ns}$$

# $\Delta t_{n\mu}$ and $\Delta t_{\gamma n}$ distribution

Require

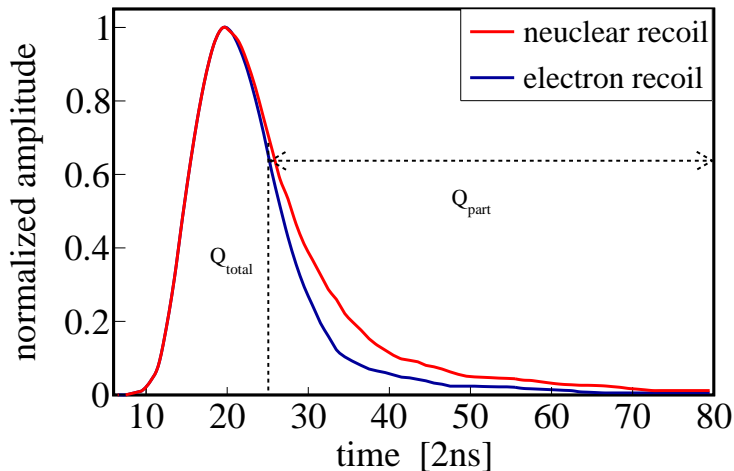

$$40\text{ns} < \Delta t_{n\mu} < 200\text{ns}$$

Require

$$2\mu\text{s} < \Delta t_{\gamma n} < 40\mu\text{s},$$
$$0.5\text{MeV} < E_\gamma < 9\text{MeV}$$

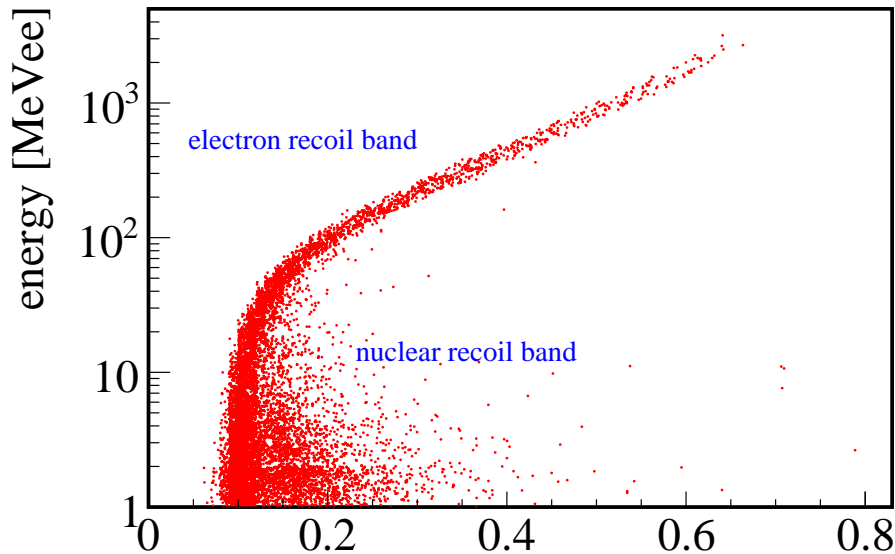

# Pulse shape discrimination

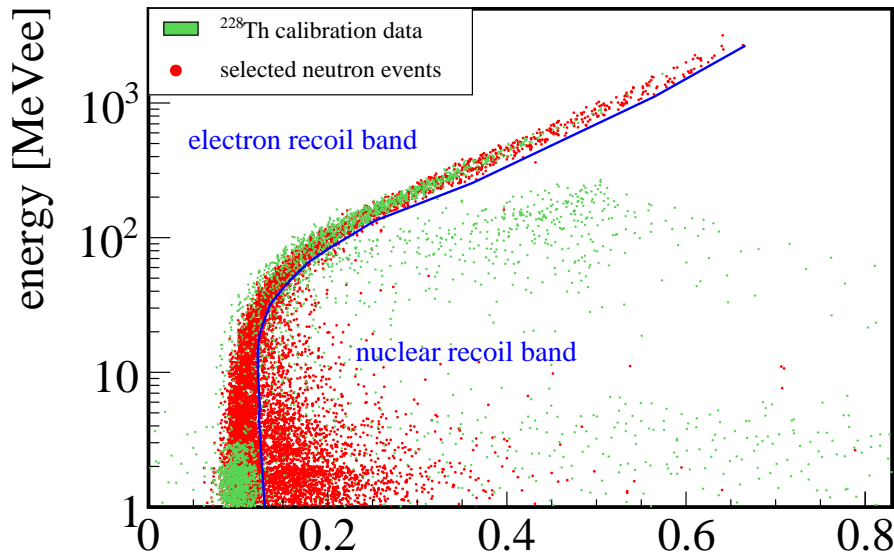

Define

$$Dis = Q_{part} / Q_{total}$$

Selected neutron events after  $\Delta t_{\mu\mu}$ ,  $\Delta t_{n\mu}$ ,  $\Delta t_{\gamma n}$  cut

# Selected neutron events compare to $^{228}\text{Th}$ data

Dis 

# Preliminary results

selection process	selected number
muon trigger events	$(7.301 \pm 0.003) \times 10^6$
events detected by neutron detector following the muon trigger events 0.5 MeVee threshold	$(4.283 \pm 0.007) \times 10^5$
captured events $0.5\text{MeV} < E_{\text{delayed}\gamma} < 9\text{MeV}$ $2\mu\text{s} < \Delta t < 40\mu\text{s}$	$(1.78 \pm 0.01) \times 10^4$
accidental events	$(4.89 \pm 0.54) \times 10^3$
selected muon induced neutron events	$(1.29 \pm 0.06) \times 10^4$
lively time	151.6 days

## Summary

- A Gd-doped liquid scintillator detector was put along with the Minidex.
- Around 5 months data had been taken from Jan. to July 2016.
- The events of muon induced neutron in lead have been selected.

## Summary

- A Gd-doped liquid scintillator detector was put along with the Minidex.
- Around 5 months data had been taken from Jan. to July 2016.
- The events of muon induced neutron in lead have been selected.

## Outlook

- Simulate the efficiencies.
- Reconstruct the energy spectrum of muon induced neutron in lead.

# Backup

# $\Delta t_{\mu\mu}$ : time difference between each two muon trackers

$$\|t_1 - t_2\| < 30ns$$

$$\|t_2 - t_3\| < 30ns$$

$$\|t_1 - t_3\| < 30ns$$

$$\|t_2 - t_4\| < 30ns$$

$$\|t_1 - t_4\| < 30ns$$

$$\|t_3 - t_4\| < 30ns$$

# Spectra of muon trackers with muon trigger condition

Require

energy deposition  $> 6$  MeV for each muon tracker

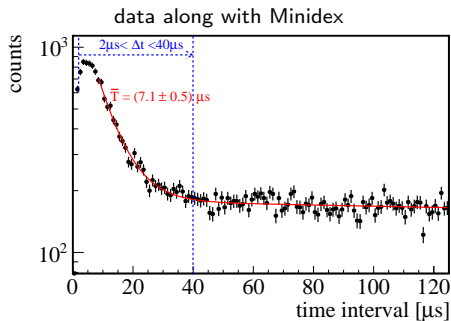

# $\Delta t_{n\mu}$ distribution

Require

$$40\text{ns} < (t_n - t_{\text{muon}}) < 200\text{ns}$$

$\Delta t_{\gamma n}$ : time difference between prompt and delayed signal

Require

$$2\mu\text{s} < (t_{\gamma} - t_n) < 40\mu\text{s}, \quad 0.5\text{MeV} < E_{\gamma} < 9\text{MeV}$$

# Selected neutron events compare to background
