

# Track vertex reconstruction with neural networks at the first level trigger of Belle II

Ringberg Young Scientist Workshop 2017

July 19, 2017

Sara Pohl  
Sebastian Skambraks, Christian Kiesling, Steffen Bähr

# Task for the first level trigger

- time dependent CP violation in  $B\bar{B}$
- typically  $\approx 3 - 9$  tracks

low track multiplicity:  $e^+e^- \rightarrow \tau^+\tau^-$

- lepton flavor violation
- genuine 2 track trigger

max. trigger rate 30 kHz  
total latency 5  $\mu$ s  
pipelined, FPGA

## Bhabha scattering

- for calibration
- needs to be prescaled
- Bhabha veto

## machine background

- z-vertex  $\neq 0$
- suppression requires 3D tracking

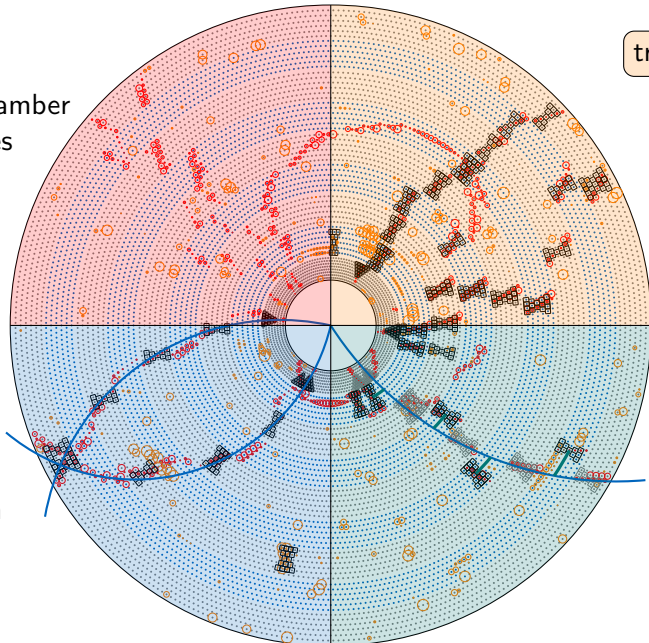

input: CDC hits

Central Drift Chamber  
14336 sense wires  
56 layers

2D track finder

circles in  
 $x - y$  plane  
Hough transform

track segment finder

combine hits  
2336 segments  
9 super layers

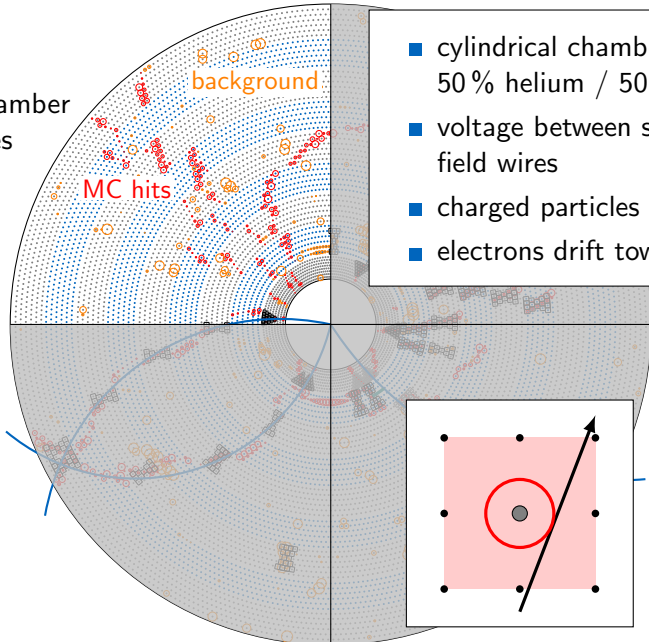

3D reconstruction

2 methods:  
neural network  
least squares fit

input: CDC hits

Central Drift Chamber  
14336 sense wires  
56 layers

- cylindrical chamber filled with 50 % helium / 50 % ethane
- voltage between sense wires and field wires
- charged particles ionize gas
- electrons drift towards sense wires

cells of sense wires  
and field wires

$$r_{\text{drift}} \propto t_{\text{drift}}$$

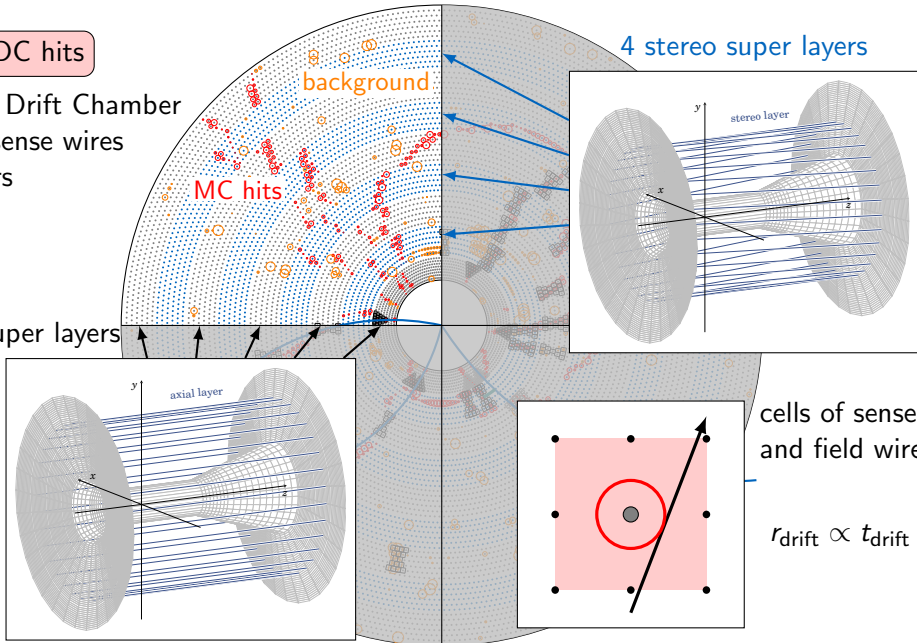

input: CDC hits

Central Drift Chamber  
14336 sense wires  
56 layers

5 axial super layers

4 stereo super layers

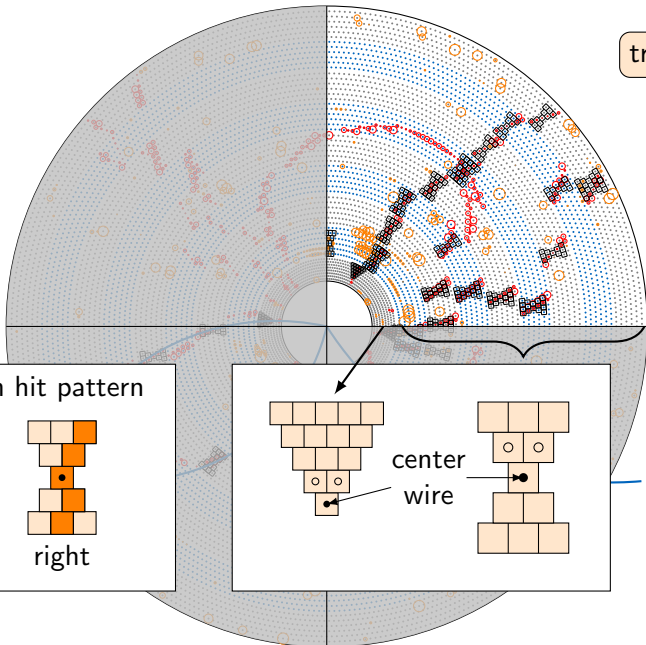

cells of sense wires  
and field wires

$$r_{\text{drift}} \propto t_{\text{drift}}$$

# Track trigger – track segment finder

track segment finder

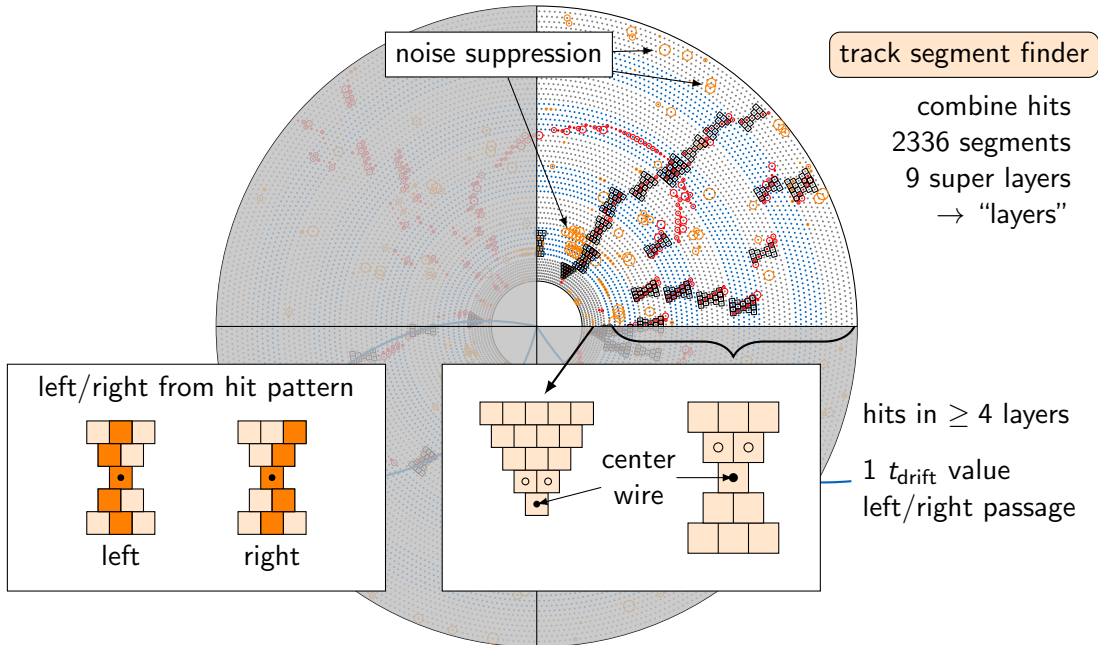

combine hits  
 2336 segments  
 9 super layers  
 → “layers”

hits in  $\geq 4$  layers  
 1  $t_{\text{drift}}$  value

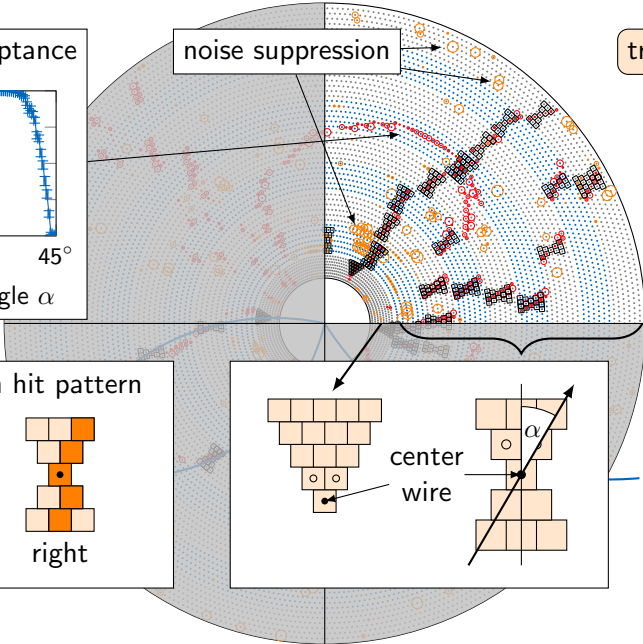

# Track trigger – track segment finder

# Track trigger – track segment finder

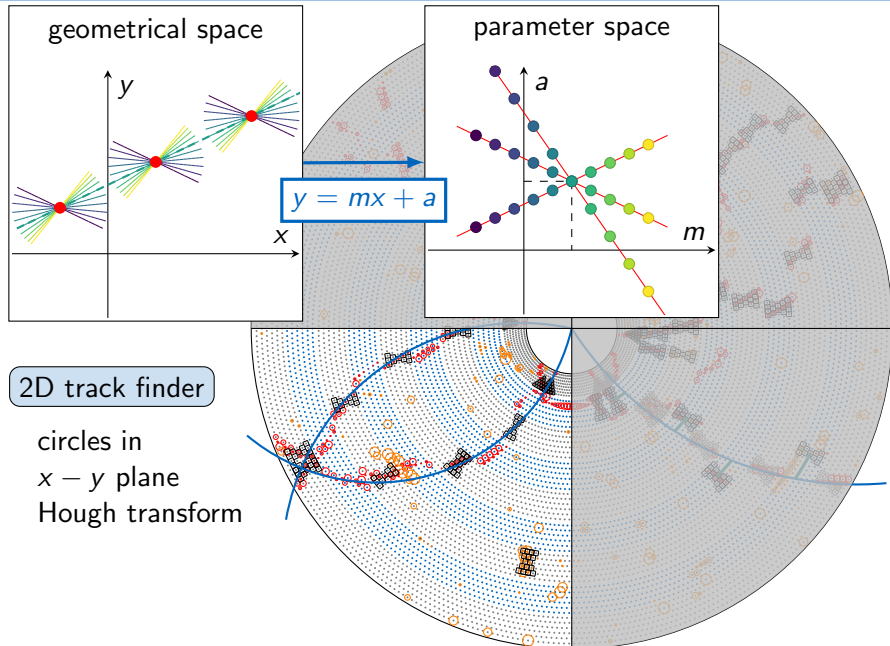

track segment finder

combine hits  
2336 segments  
9 super layers  
→ "layers"

hits in  $\geq 4$  layers  
1  $t_{drift}$  value  
left/right passage

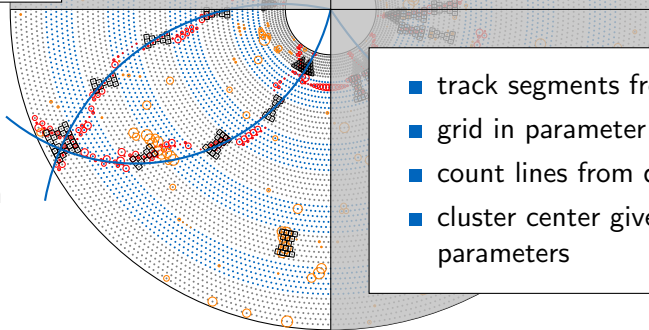

# Track trigger – 2D track finder

## 2D track finder

circles in  
x – y plane  
Hough transform

- track segments from axial layers
- grid in parameter space
- count lines from different layers
- cluster center gives track parameters

acceptance:  
 $\theta \in [31^\circ, 126^\circ]$

track finding efficiency

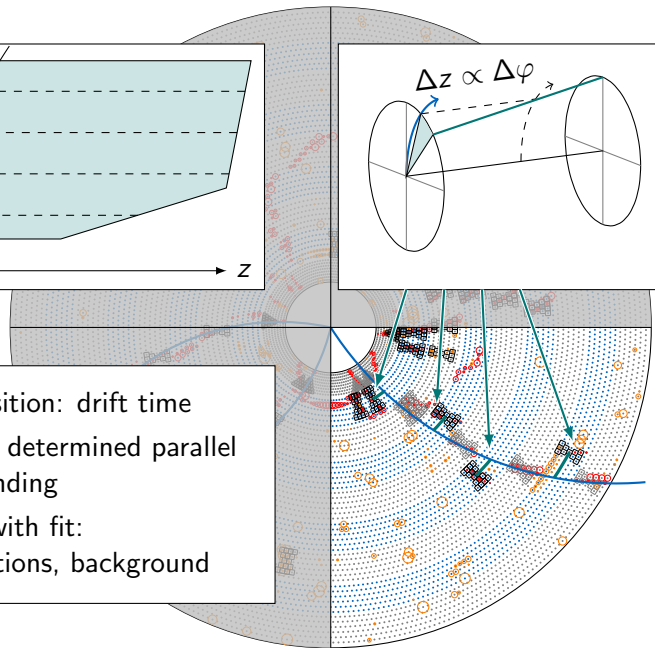

acceptance:  
 $p_t \geq 0.38 \text{ GeV}$

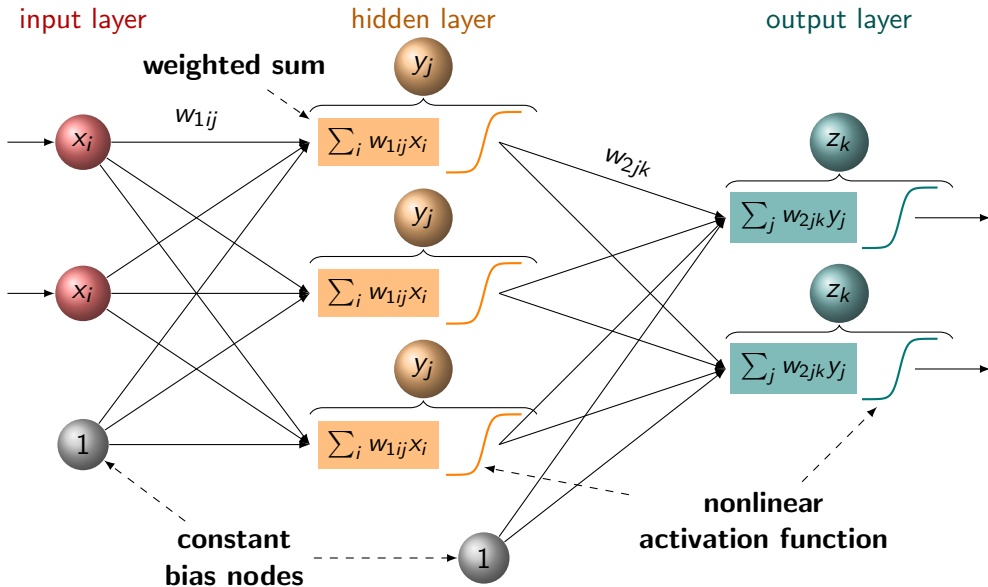

4 z-coordinates  
from stereo hits  
and 2D tracks

- precise position: drift time
- event time determined parallel to track finding
- problems with fit: approximations, background

3D reconstruction

2 methods:  
neural network  
least squares fit

**hit candidates:**

$\Delta\varphi$  region  
time window

**hit selection:**

left/right  
short time

- drift time separately  $\rightarrow$  nonlinear corrections
- crossing angle  $\alpha$ : track curvature
- axial inputs: 2D track corrections

**hit candidates:**

$\Delta\varphi$  region  
time window

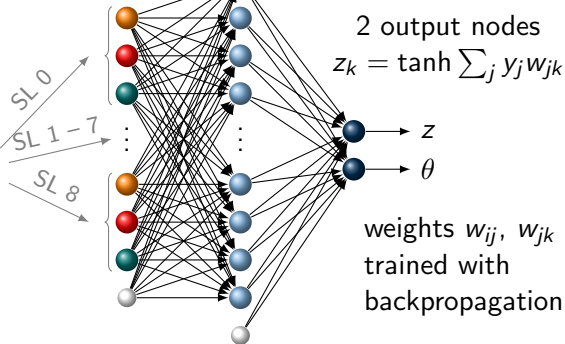

**hit selection:**

left/right  
short time

9x

27 inputs  $x_i$

127 hidden nodes

$$y_j = \tanh \sum_i x_i w_{ij}$$

2 output nodes

$$z_k = \tanh \sum_j y_j w_{jk}$$

weights  $w_{ij}$ ,  $w_{jk}$   
trained with  
backpropagation

- drift time separately  $\rightarrow$  nonlinear corrections
- crossing angle  $\alpha$ : track curvature
- axial inputs: 2D track corrections

- missing axial hit: default inputs (0, 0, 0)
- missing stereo hit: expert network

resolution depends on

- missing hits
- track curvature
- background hits

input: CDC hits

3D reconstruction

per 2D track  
add stereo hits  
neural network

$B\bar{B} \rightarrow$  generic

$\tau^+\tau^- \rightarrow$  generic

$\tau \rightarrow \mu\gamma$

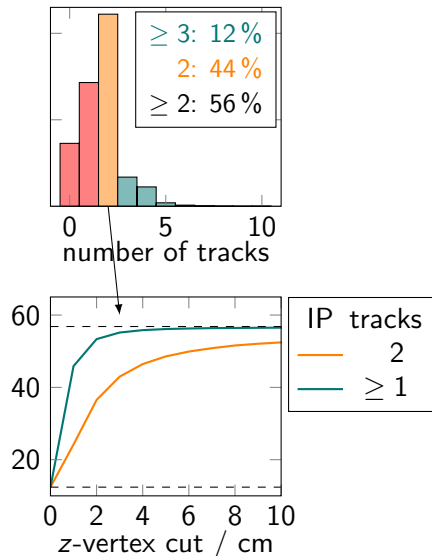

$B\bar{B} \rightarrow$  generic

$\tau^+\tau^- \rightarrow$  generic

$\tau \rightarrow \mu\gamma$

- time dependent CP violation in  $B\bar{B}$
- typically  $\approx 3 - 9$  tracks

low track multiplicity:  $e^+e^- \rightarrow \tau^+\tau^-$

- lepton flavor violation
- genuine 2 track trigger

Bhabha scattering

- for calibration
- needs to be prescaled
- Bhabha veto

machine background

- $z\text{-vertex} \neq 0$
- suppression requires 3D tracking

- time dependent CP violation in  $B\bar{B}$
- typically  $\approx 3 - 9$  tracks

low track multiplicity:  $e^+e^- \rightarrow \tau^+\tau^-$

- lepton flavor violation
- genuine 2 track trigger

Bhabha scattering

- for calibration
- needs to be prescaled
- Bhabha veto

machine background

- z-vertex  $\neq 0$
- suppression requires 3D tracking

$e^- \rightarrow \gamma(4S) \rightarrow B_{tag}$   
 efficiency  $\approx 98\%$  ✓  
 (100% including calorimeter)  
 $\Delta Z \propto \Delta t$

- time dependent CP violation in  $B\bar{B}$
- typically  $\approx 3 - 9$  tracks

low track multiplicity:  $e^+e^- \rightarrow \tau^+\tau^-$

efficiency  $\approx 56\%$  ✓  
 (12% for  $\geq 3$  tracks)  
 $\rightarrow$  gain factor **4.7**

- lepton flavor violation
- genuine 2 track trigger

### Bhabha scattering

- for calibration
- needs to be prescaled
- Bhabha veto

### machine background

- $z$ -vertex  $\neq 0$
- suppression requires 3D tracking

$e^- \rightarrow \gamma(4S) \rightarrow B_{tag}$   
 efficiency  $\approx 98\%$  ✓  
 (100% including calorimeter)  
 $\Delta Z \propto \Delta t$

- time dependent CP violation in  $B\bar{B}$
- typically  $\approx 3 - 9$  tracks

low track multiplicity:  $e^+e^- \rightarrow \tau^+\tau^-$

efficiency  $\approx 56\%$  ✓  
 (12% for  $\geq 3$  tracks)  
 $\rightarrow$  gain factor **4.7**

- lepton flavor violation
- genuine 2 track trigger

Bhabha scattering

$e^- e^+ \rightarrow \gamma \rightarrow e^- e^+$

- for calibration
- Bhabha veto

**background suppression: following talk by Sebastian**

machine background

- $z\text{-vertex} \neq 0$
- requires 3D tracking

# Backup

**several hits per layer:**

1. known left/right
2. short drift time
