Muon trigger for HL-LHC

Eventually, will need to replace current RPCs...

- Lifetime 100kHz/cm² for 10 years
- Rates in HL-LHC will increase sevenfold

In the meantime, we can extend their lifespan...

- Increase number of layers
- Fill the blind spots
- New coincidence requirements
→ **each RPC has less work**

The BI project

INFN/University of Roma Tor Vergata, Rome, and MPP, Munich

...and mitigate aging by reducing workload.

2024-26: 96 new sMDT-RPCs (1410 m²)

2019-20: 16 new sMDT-RPCs (150 m²)

↳ Require only 2/4 coincidence from BM RPCs

BENEFITS

1. Close acceptance holes
2. Loosen coincidence requirements
 - Improve efficiency at same HV
 - Reduce HV of legacy RPCs
 - Extend system longevity

SYSTEM EFFICIENCY @ VARIOUS COINCIDENCE REQUIREMENTS

New sMDT-RPC chambers

Gas inlet		
Ionizing gas	95%	TFE
Quencher gas	4.5%	i-C4H10
Electronegative gas	0.3%	SF6

FE electronics
 New fast, sensitive amplifier
 100ps resolution
 Fast serial output

Thin RPC triplets
 1 mm gas gaps
 1.2 mm electrodes
 5800 V
 15x less avalanche charge

BIS78 sMDT
 Covered in other talks

BIS78 RPC triplets

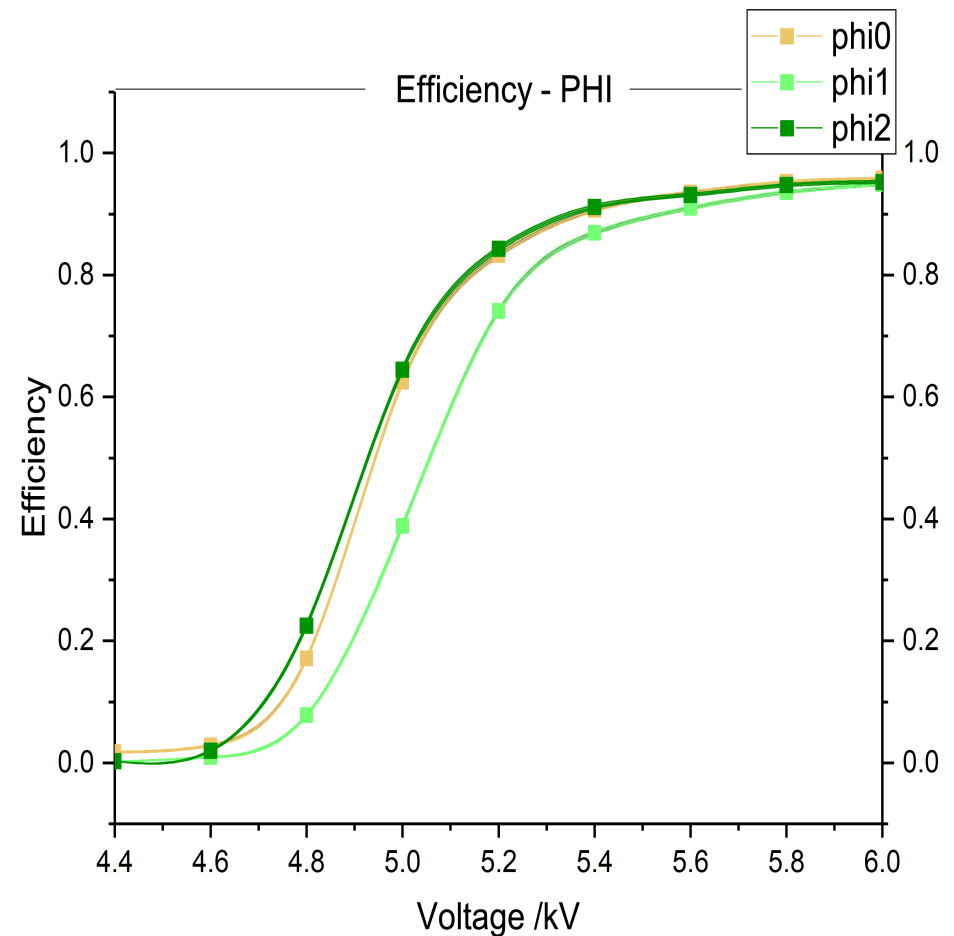

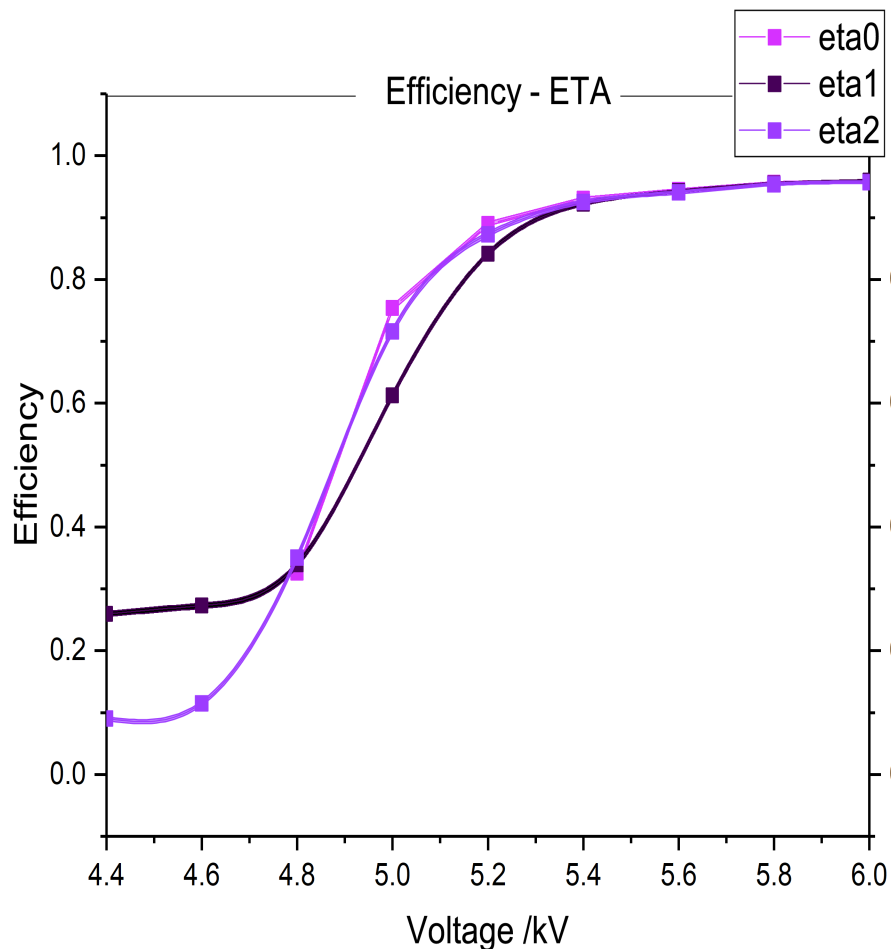

Test setup at H8

- Test beam: Muons and energetic pions (no background)
- Scintillator-triggered TDC data
- Time recorded to nearest nanosecond (close to intrinsic RPC resolution)
 - With several layers collecting data we will achieve subnanosecond resolution

Efficiency

- Nominal voltage 5.6kV
- Efficiency plateau begins 5.4kV
- Resolution gains to be had by operating a little higher...

Time resolution

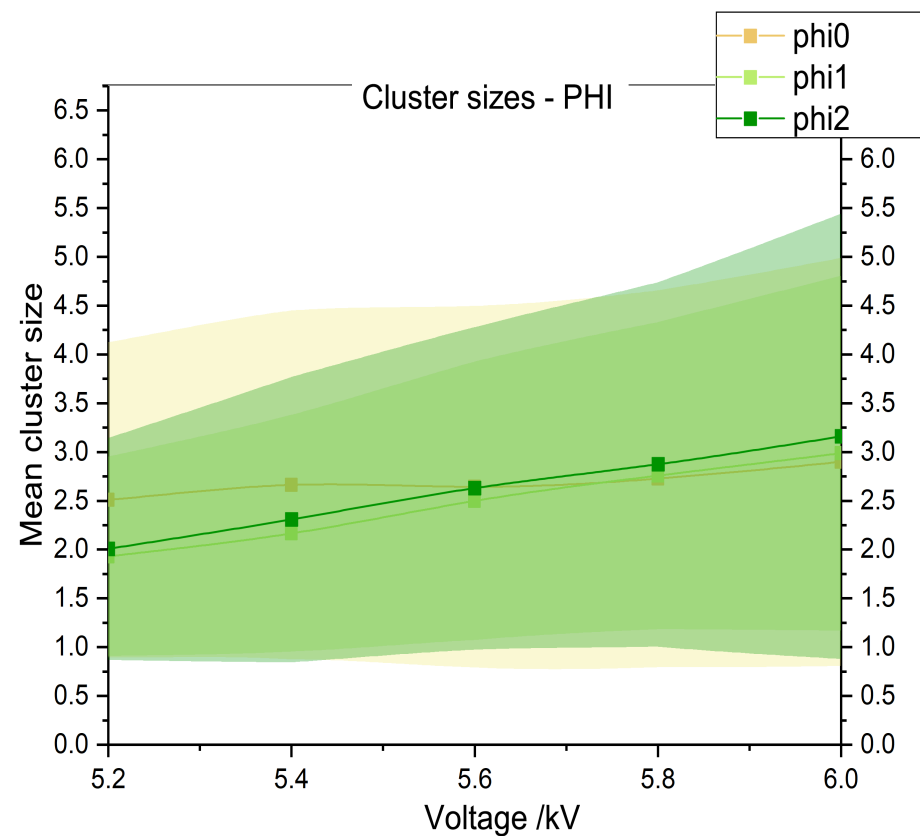

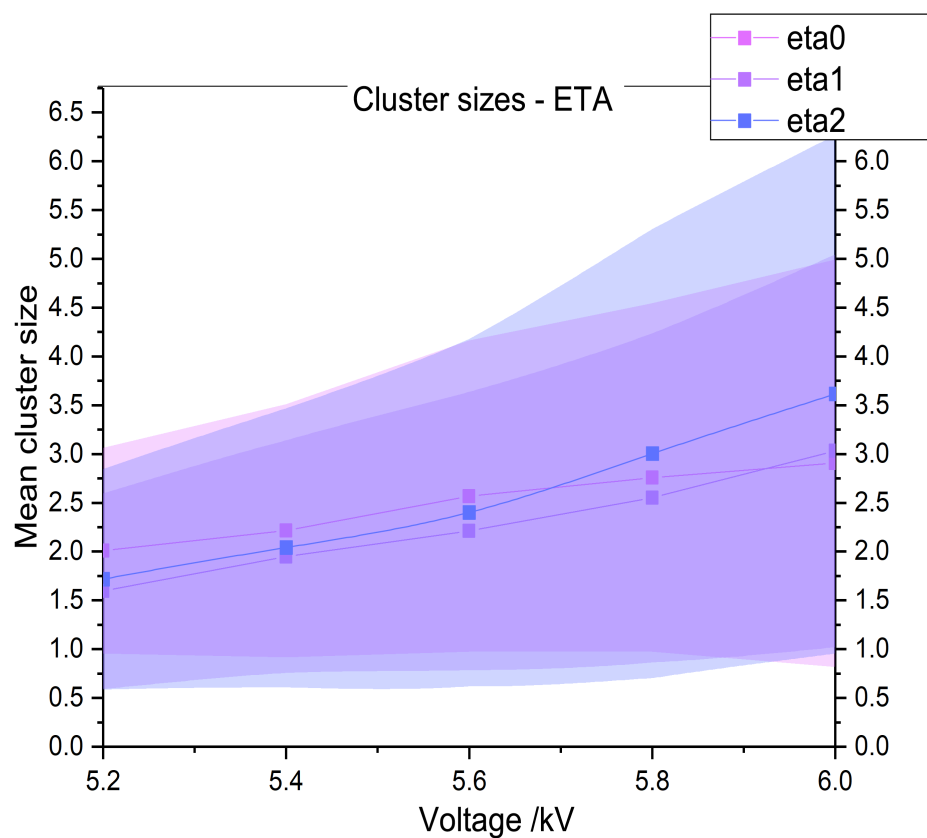

- $0.557/\sqrt{2} = 0.394$ ns down from 1.1 ns
- Principally thanks to thinner gap, thinner electrodes
- No walk correction, temperature/humidity correction applied

(Voltage sweep data to come...)

Cluster size

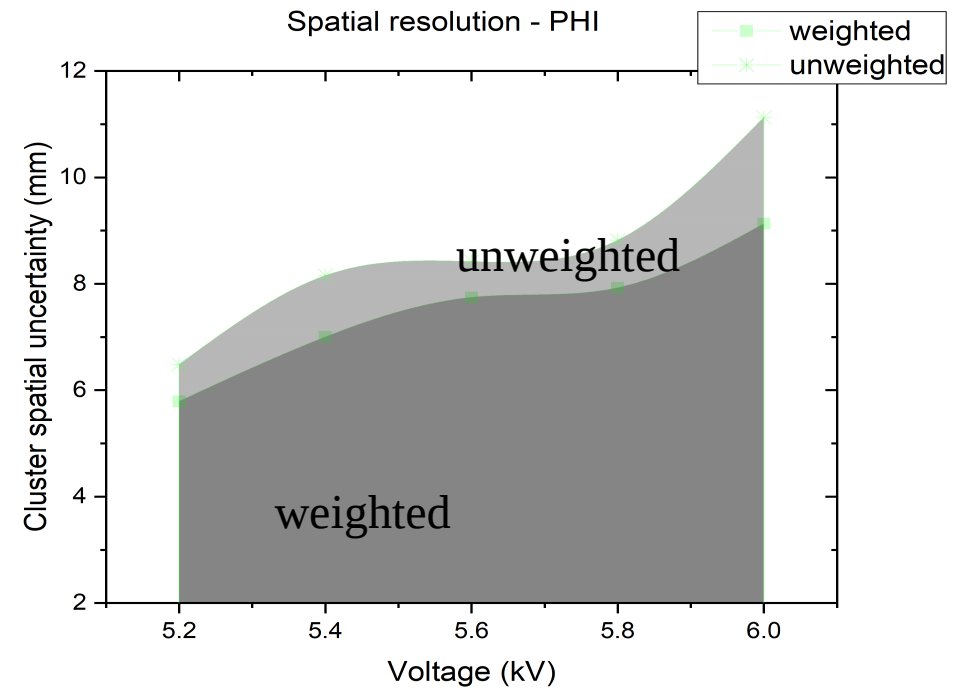

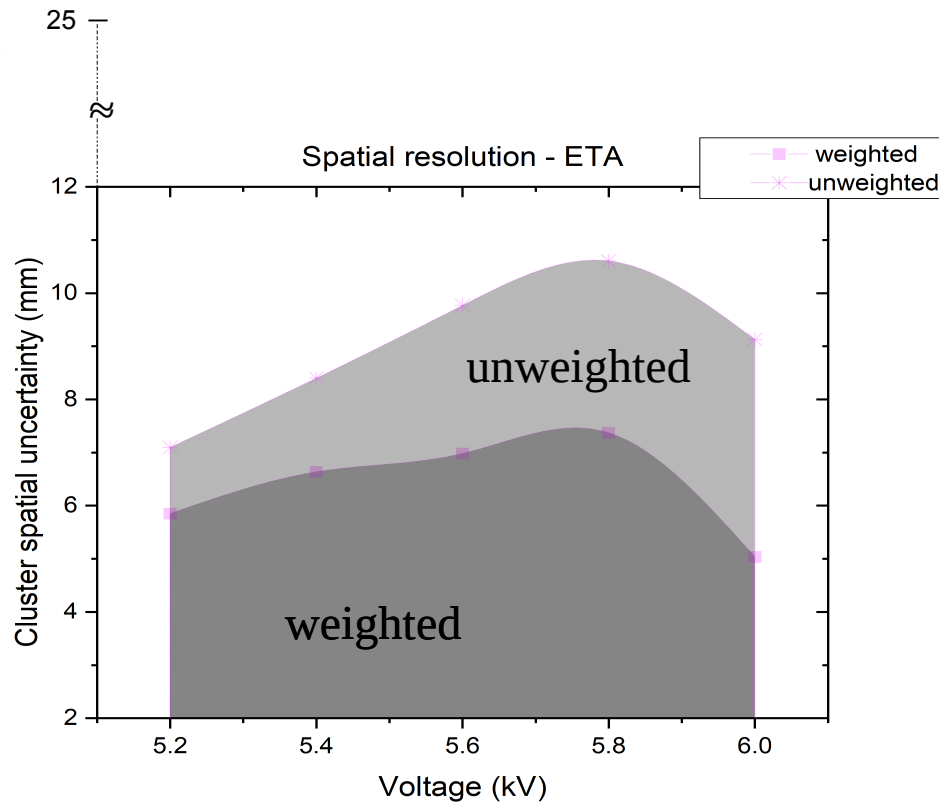

- Optimal cluster size ~ 2
- Steady growth as gas gain increases
- Spatial resolution at 5.6kV:
 - 13.5 mm unweighted, **11.3 mm weighted**

Spatial resolution

- Weighting cluster position by time over threshold (dark gray)
- Resolution of less than half a strip width

Strip width

Summary: Results of voltage sweep

- **Singlet efficiency** above 95% at nominal voltage
 - Plateau begins as low as 5400V
- **Multilayer coincidence** around 80% of the time
- **Cluster size** just big enough for strip redundancy
- **Time resolution** improved by a factor of 3
- **Spatial resolution** half a strip width

End

If you take a bale of hay and tie it to the tail of a mule and then strike a match and set the bale of hay on fire, and if you then compare the energy expended shortly thereafter by the mule with the energy expended by yourself in the striking of the match, you will understand the concept of amplification.

(William Shockley)

RPC development

Pure phenolic glass

0.5 mm Gap with 0.5 mm ThinElectrodes

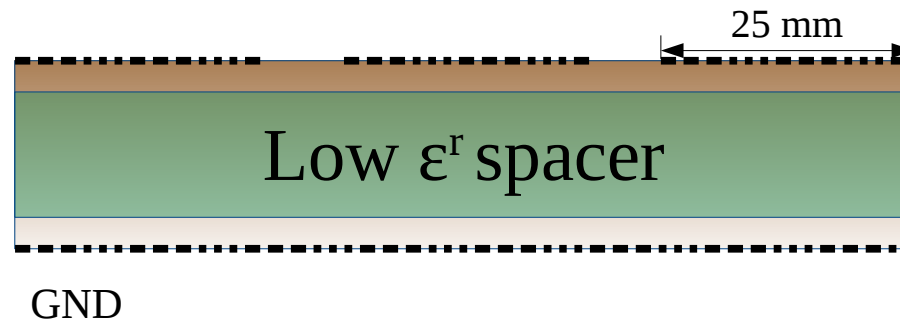

0.5 mm Gap with 0.5 mm ThinElectrodes

Effect of thin electrodes

- $q_{ind} / Q = 1 / (1 + 2t / \epsilon_r g)$ relates charge induced on an electrode q_{ind} to its thickness t
- (Q is the total charge in the gas, g is the gas gap)
- Signal attenuation proportional to t

The aging process

<https://doi.org/10.1016/j.nima.2006.05.130>

Gas inlet		
Ionizing gas	95%	TFE
Quencher gas	4.5%	i-C ₄ H ₁₀
Electronegative gas	0.3%	SF ₆

New strip panel layout

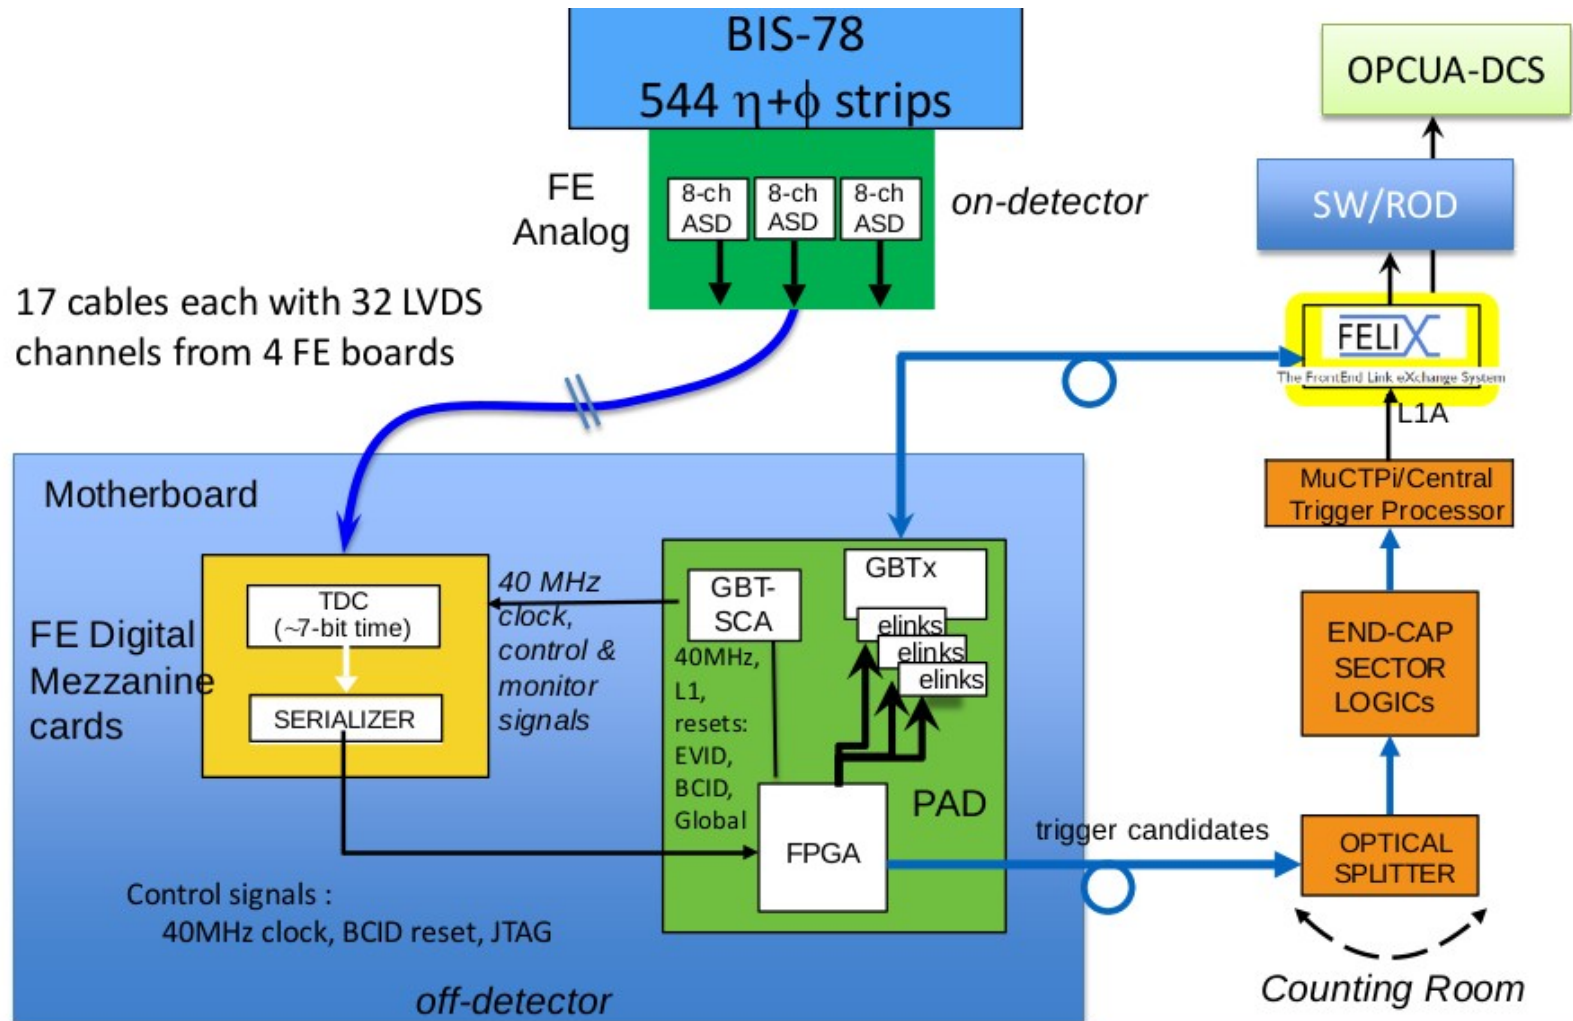

- Replacing the milled PET film by Fiberglass photo printed skins + Forex strip panel

8 channels backend
PCB
