

Electroweak bremsstrahlung effects on Dark Matter abundance

Petter Taule
NTNU

Overview

About me

Groundwork

Dark matter indirect search

- Neutralino
- Accompanied bremsstrahlung processes

Electroweak bremsstrahlung

- Quark pair production

Summary

About me

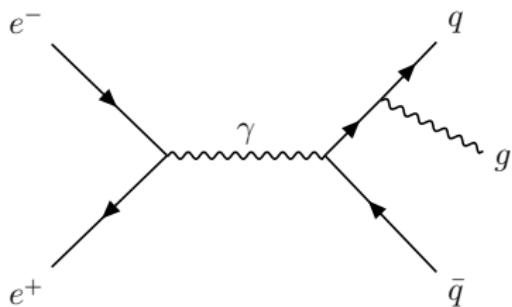

- Originally from Oslo, Norway
- Currently enrolled in a Master program in Physics
- Norwegian University of Science and Technology (NTNU) in Trondheim
- Supervisor: Prof. Michael Kachelrieß (NTNU)

Figure: Trondheim

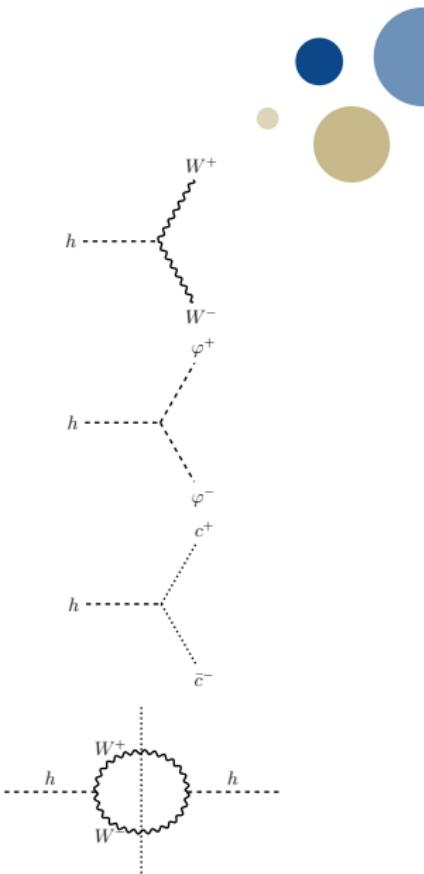

Starting Point

- QCD: Quark pair production, gluon emission
- IR divergencies
- Kinoshita-Lee-Nauenberg (KLN) theorem
- Go to the massive case ↓

Intermezzo: $h \rightarrow W^+W^-$

- Different approaches:
 - i) Unitary gauge
 - ii) Feynman-'t Hooft gauge — additional Goldstone bosons, ghosts
 - iii) Using Goldstone boson equivalence theorem (GBET) — additional Goldstone bosons
 - iv) Cutkosky cut of charged boson loop
- Pedagogical paper

Dark Matter I

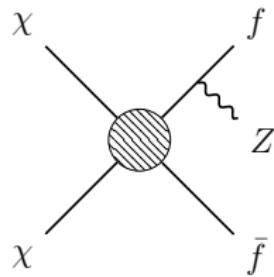

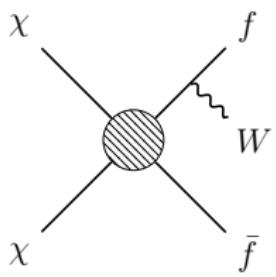

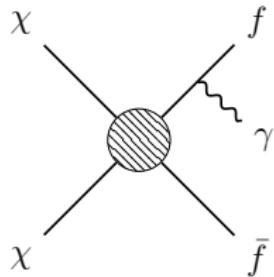

- Indirect search for Dark Matter (DM)
- Popular DM candidate: Neutralino
 - Lightest SUSY particle in the MSSM
 - Majorana spin-1/2 particle
- DM annihilation (exclusively) into SM particles

$$\chi + \chi \rightarrow f + \bar{f}, \dots \quad (1)$$

- Helicity suppression

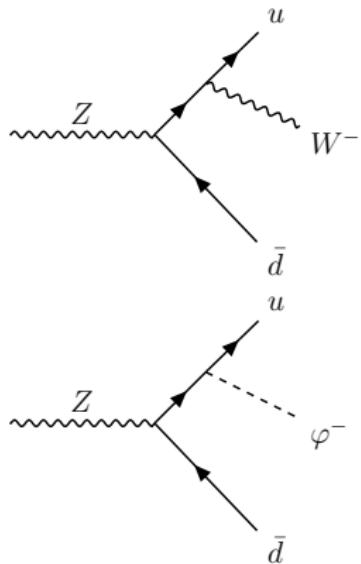

Dark Matter II

- Bremsstrahlung processes
 - Photon bremsstrahlung
 - W/Z bremsstrahlung
- Decay of W/Z leads to photon, lepton and/or hadron production

Electroweak bremsstrahlung I

- Consider s-channel fermion pair production
 - Initial and final state factorizes
- Include bremsstrahlung diagrams
- Assume $m_\chi \gg m_W, m_Z$
- Goldstone boson equivalence theorem

Electroweak bremsstrahlung II

- Large logarithms $\sim \ln^2(m_\chi^2/m_W^2)$ in total cross sections
- Compare with gluon emission
- Bremsstrahlung processes: significant annihilation channels
- Constrain DM particle properties

Summary

- Majorana Dark Matter particle (e.g. neutralino)
- Annihilation into SM particles
- Electroweak bremsstrahlung
- Large logarithms
- DM particle constraints
