

Phase2 Track Analysis

Purpose:

Study Vertex Distributions
from Luminosity runs

Data reconstruction: BASF2 release-02-00-01 (Prod 5)

Run at KEK, input: DST

prepare a „mini-DST“ with the following variables

```
list_of_variables = [  
    'expNum', 'runNum', 'evtNum', 'nTracks', 'E', 'px', 'py', 'pz', 'p', 'cosTheta', 'dr',  
    'd0', 'phi0', 'omega', 'z0', 'tanlambda', 'pionID', 'muonID', 'electronID', 'protonID'  
]
```

Select runs towards the end of Phase 2
(improved injection)

Run	Date	Curr.[mA]	# Bunches	Size y[μm]	CDC [μA]	vac [10^{-8} Torr]
4814	06/29	240/230	789	101/108	24.2	3.0 / 6.7
5187	07/04	217/226	395	68/145	19.6	1.9 / 4.3

Track parameters extracted from DST reconstruction

-> need to train networks on reconstructed track data

Background strongly changes with beam conditions

Possible reasons: towards end of Phase 2

- the vacuum improved
- injection better understood

Consequence:

- $z \neq 0$ tracks decreased relative to vertex tracks
- backgrounds look similar in shape
- suggest now training of networks with real data
