

Developing a Displaced Vertex Trigger for Dark Matter Searches at the Belle II Experiment

July 12th, 2023
Elia Schmidt

- ◆ Evidence for dark matter (DM) is overwhelming

Evidence for dark matter from (1) and (2)

- ◆ No signal despite great experimental efforts
- ◆ New models with dark sectors
- ◆ Evade direct detection
- ◆ Discovery potential at colliders

Example vertex of inelastic dark matter

Inelastic Dark Matter (iDM)

- ◆ iDM could be produced at LHC and Belle II
- ◆ For large DM masses ($\sim 100\text{GeV}$) LHC favoured (4)
- ◆ Otherwise, clean environment of lepton colliders favoured
- ◆ **Belle II** is well suited

- ◆ iDM could be produced at LHC and Belle II
- ◆ For large DM masses ($\sim 100\text{GeV}$) LHC favoured (3)
- ◆ Otherwise, clean environment of lepton colliders favoured
- ◆ **Belle II** is well suited

Why is iDM challenging?

- ◆ Search limited by trigger efficiency
- ◆ Long-lived neutral particle
- ◆ Belle II built to detect tracks from collision point
- ◆ Displaced Vertex Trigger (DVT) needed

Projected sensitivity of Belle II to iDM (4)

Belle II & SuperKEKB

Belle II & SuperKEKB

Central Drift Chamber (CDC)

iDM example event (simulated)

- ◆ Wires fire when charged particle passes
- ◆ CDC triggers are track finders
- ◆ Using the Hough transform
- ◆ Main track trigger of Belle II: Single Track Trigger

iDM example event (simulated)

- ◆ Wires fire when charged particle passes
- ◆ CDC triggers are track finders
- ◆ Using the Hough transform
- ◆ Main track trigger of Belle II: Single Track Trigger

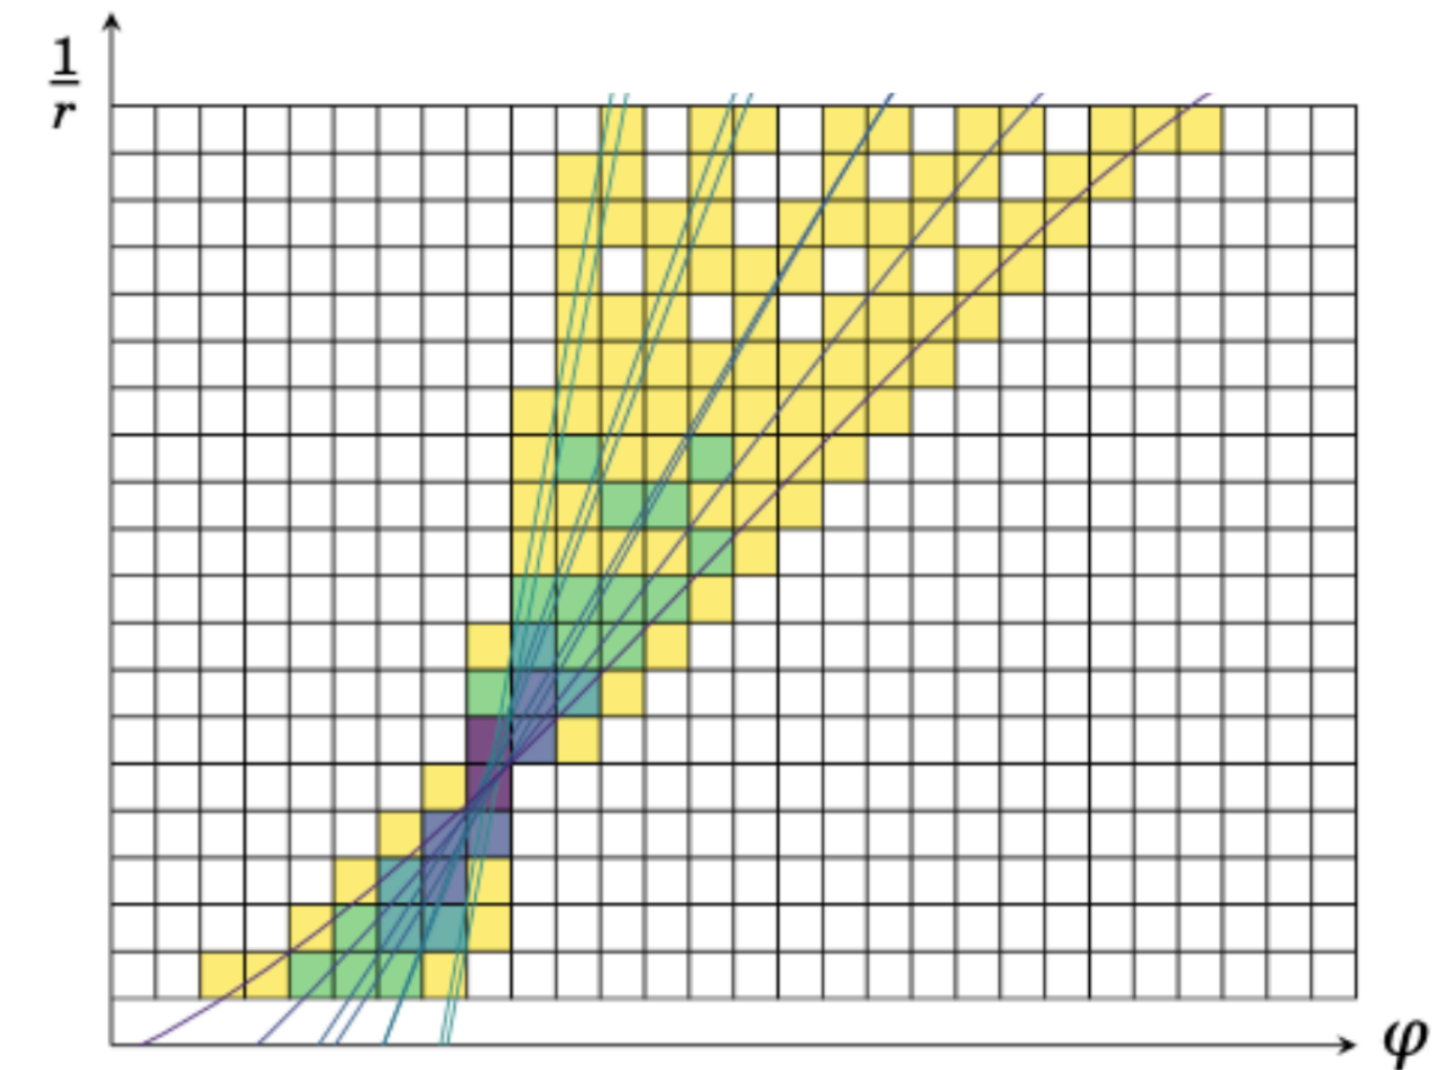

Efficiency of the single track trigger (5)

Hough Transform

- ◆ Geometrical space $(x, y) \rightarrow$ Parameter space (r^{-1}, φ)
- ◆ Track finding \rightarrow Peak finding
- ◆ Conformal mapping: 2D circles \rightarrow Straight lines
- ◆ Requires setting of reference vertex, normally $(0,0)$

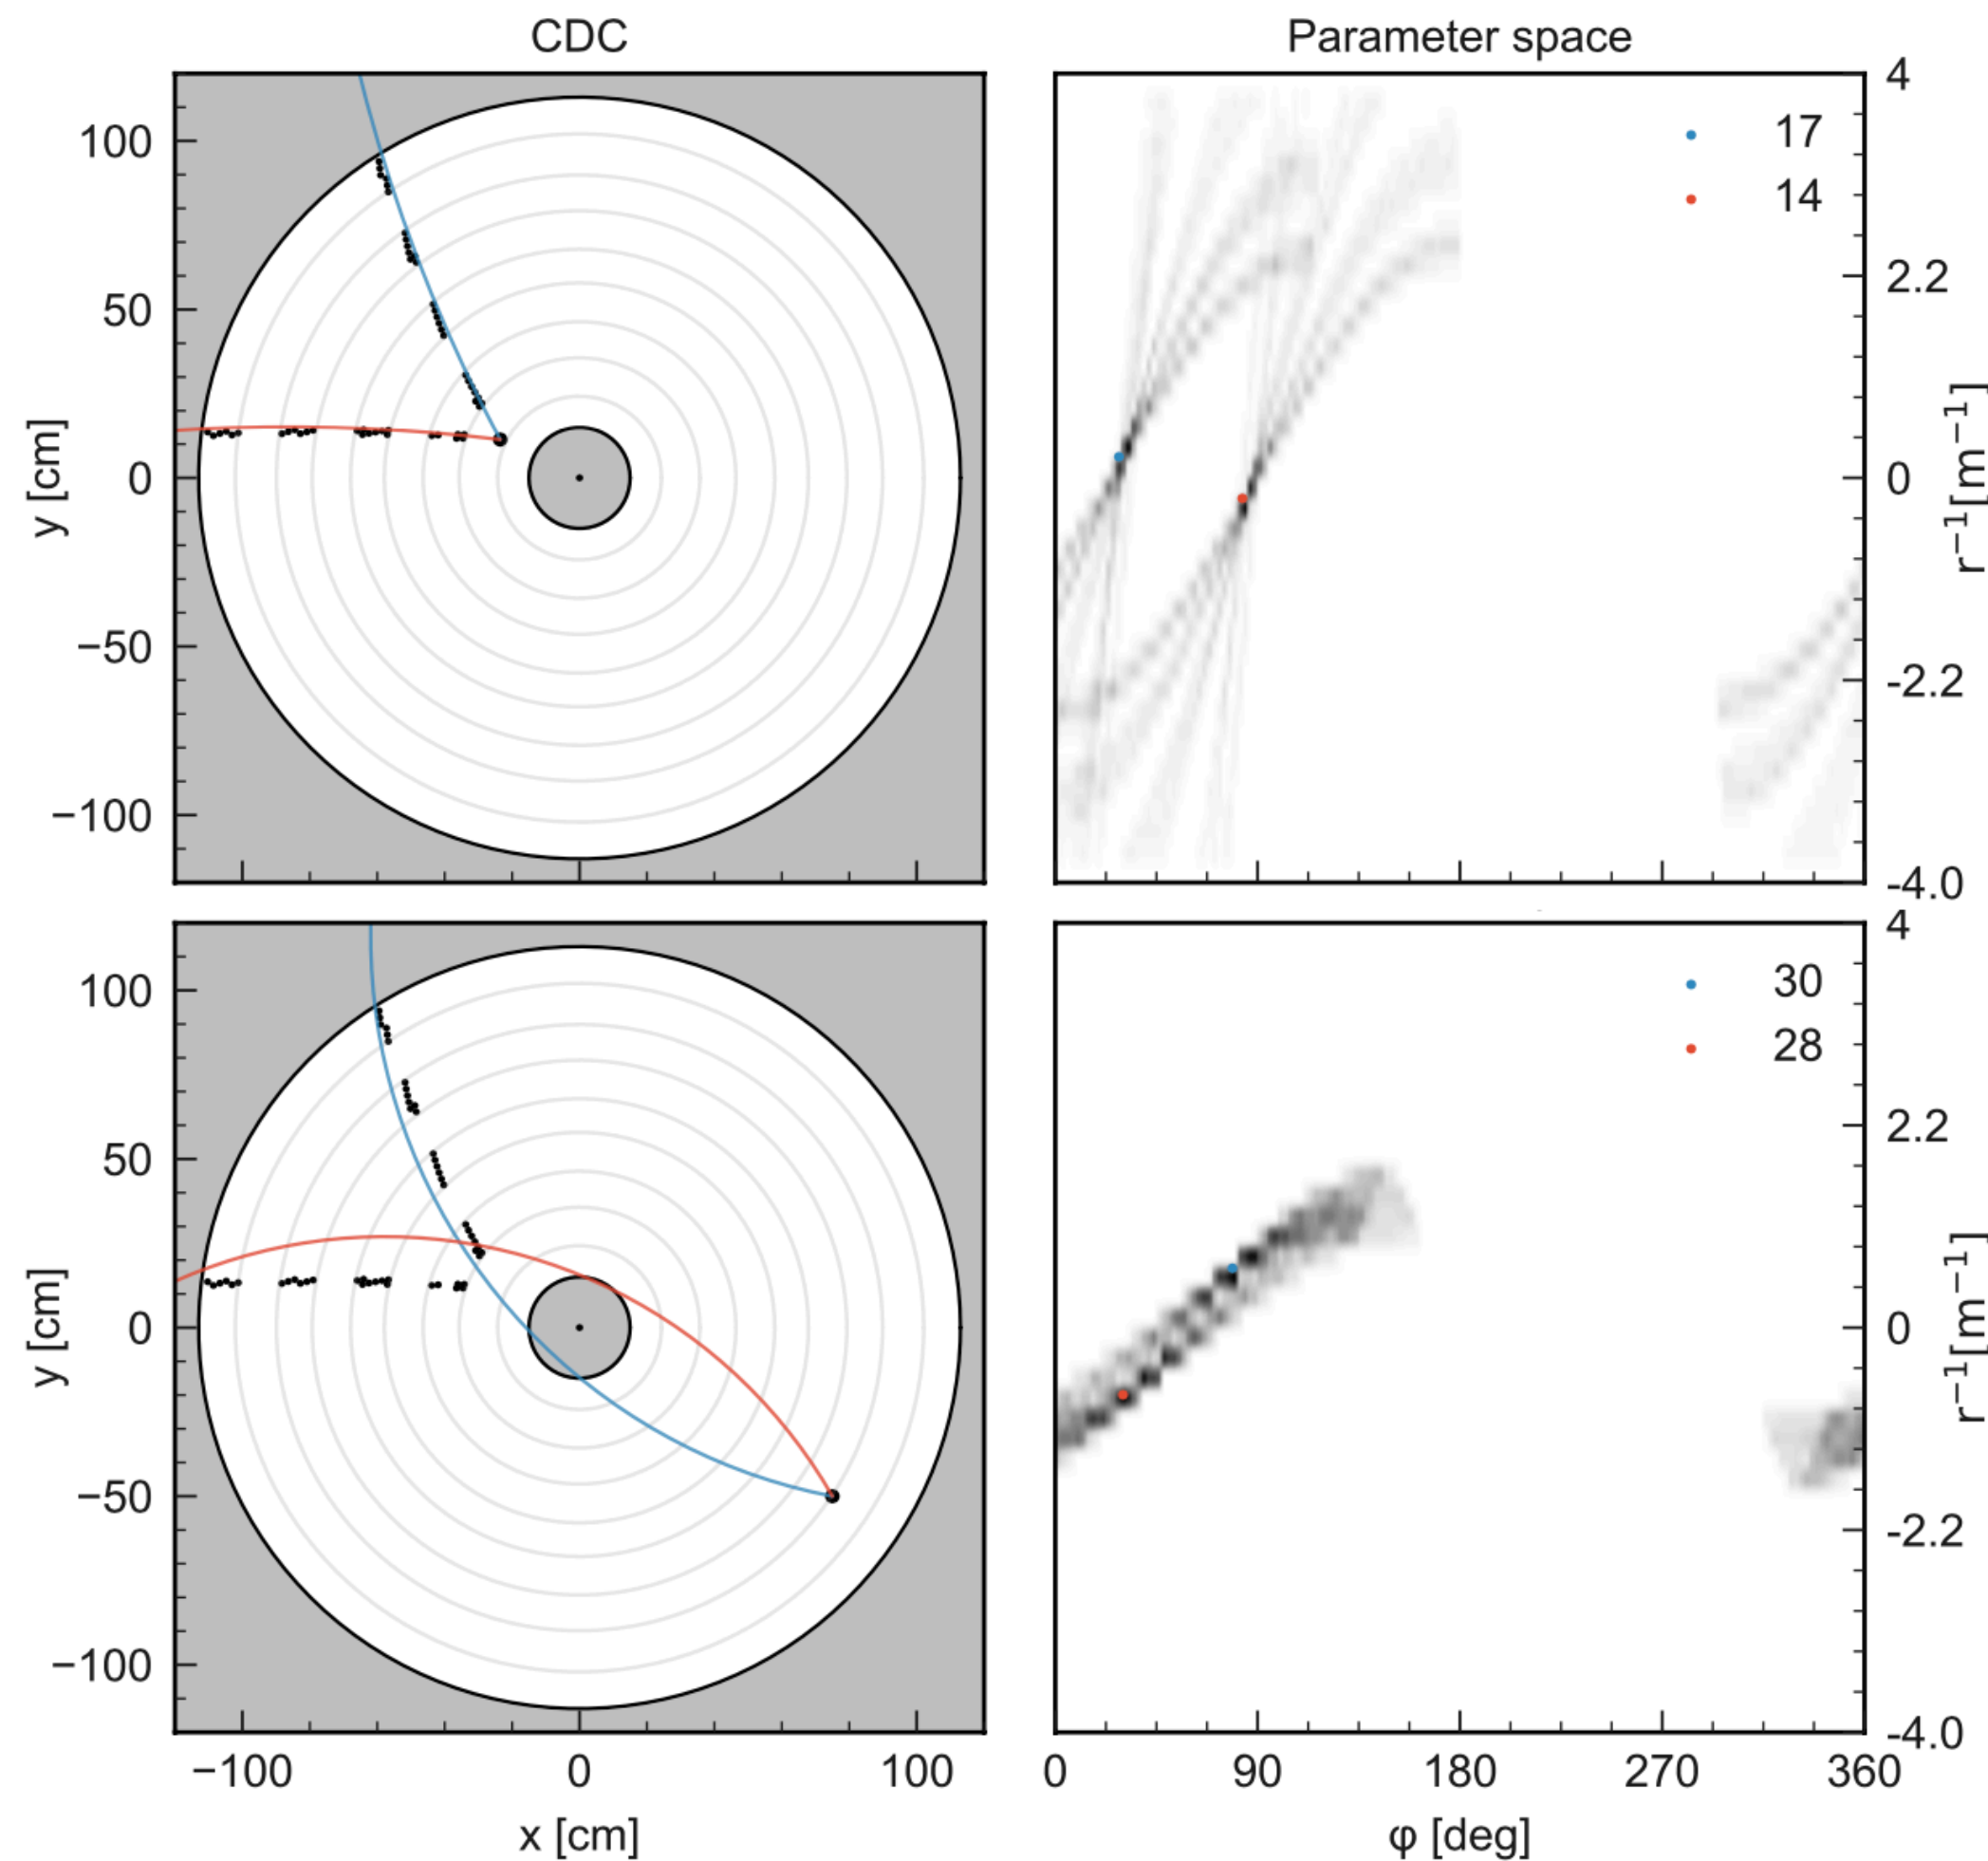

$$\frac{1}{r} = x \cdot \cos \varphi + y \cdot \sin \varphi$$

Basic idea of the Hough transform (6)

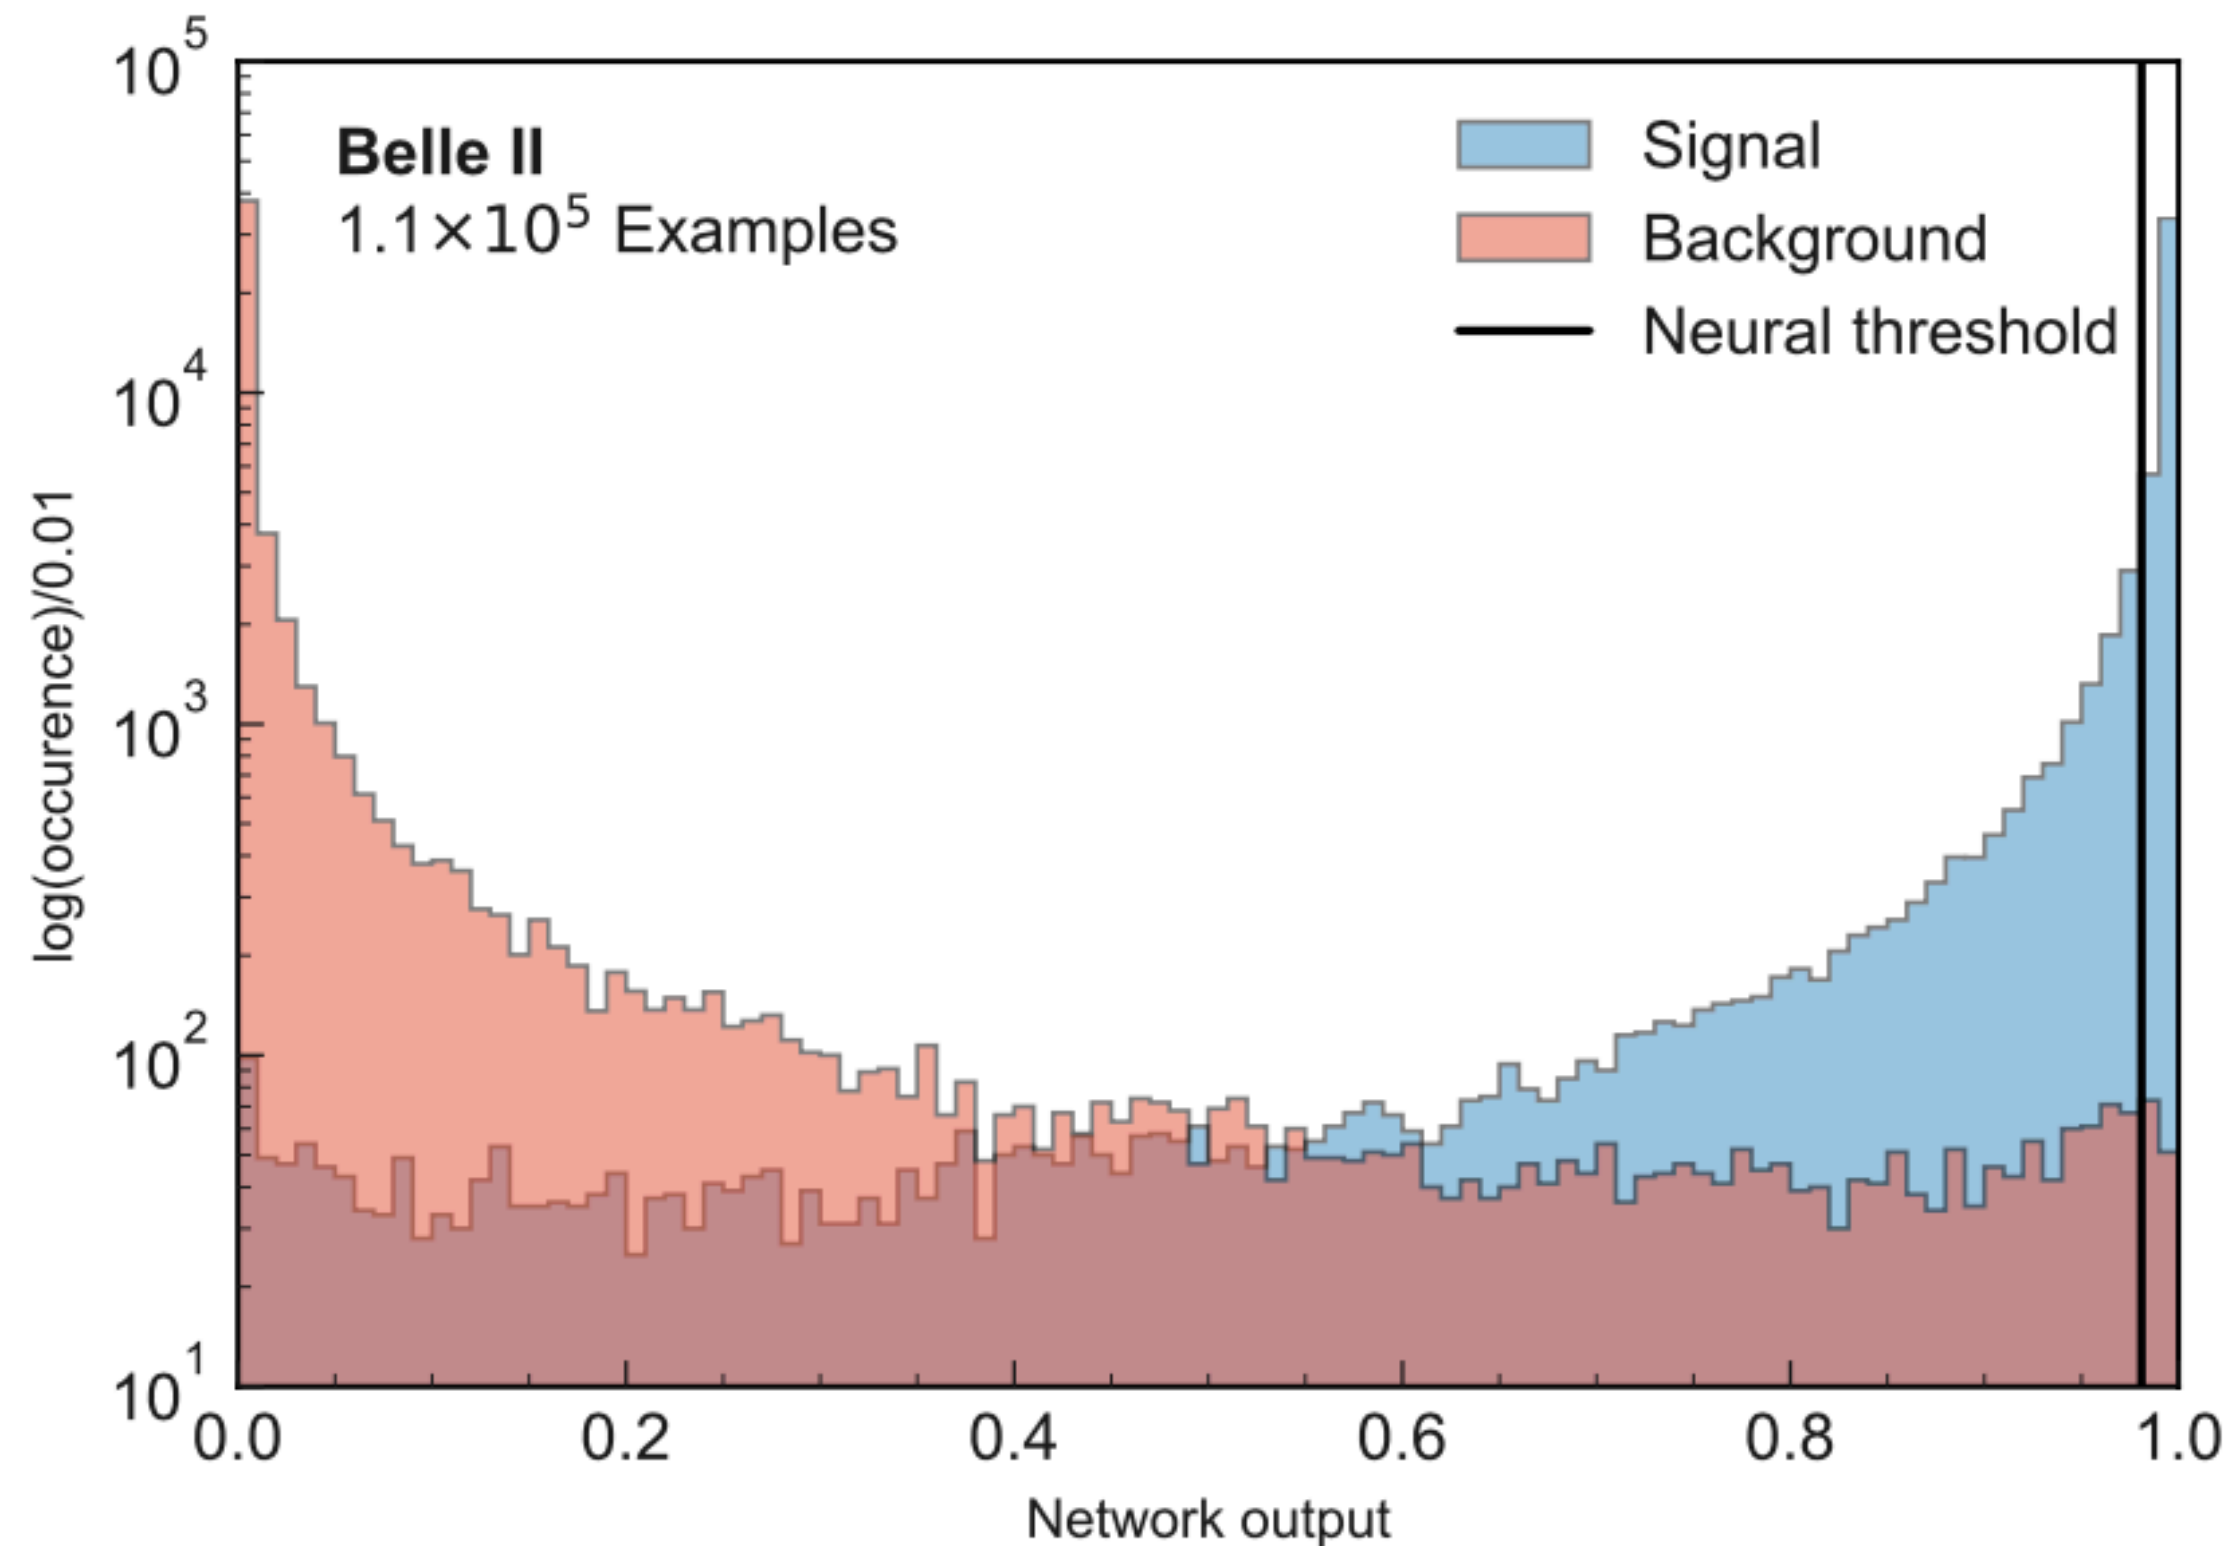

- ◆ ~400 reference vertices (MacroCells)
- ◆ Hough transforms in parallel, assuming MacroCell as vertex
- ◆ Select promising vertex candidate

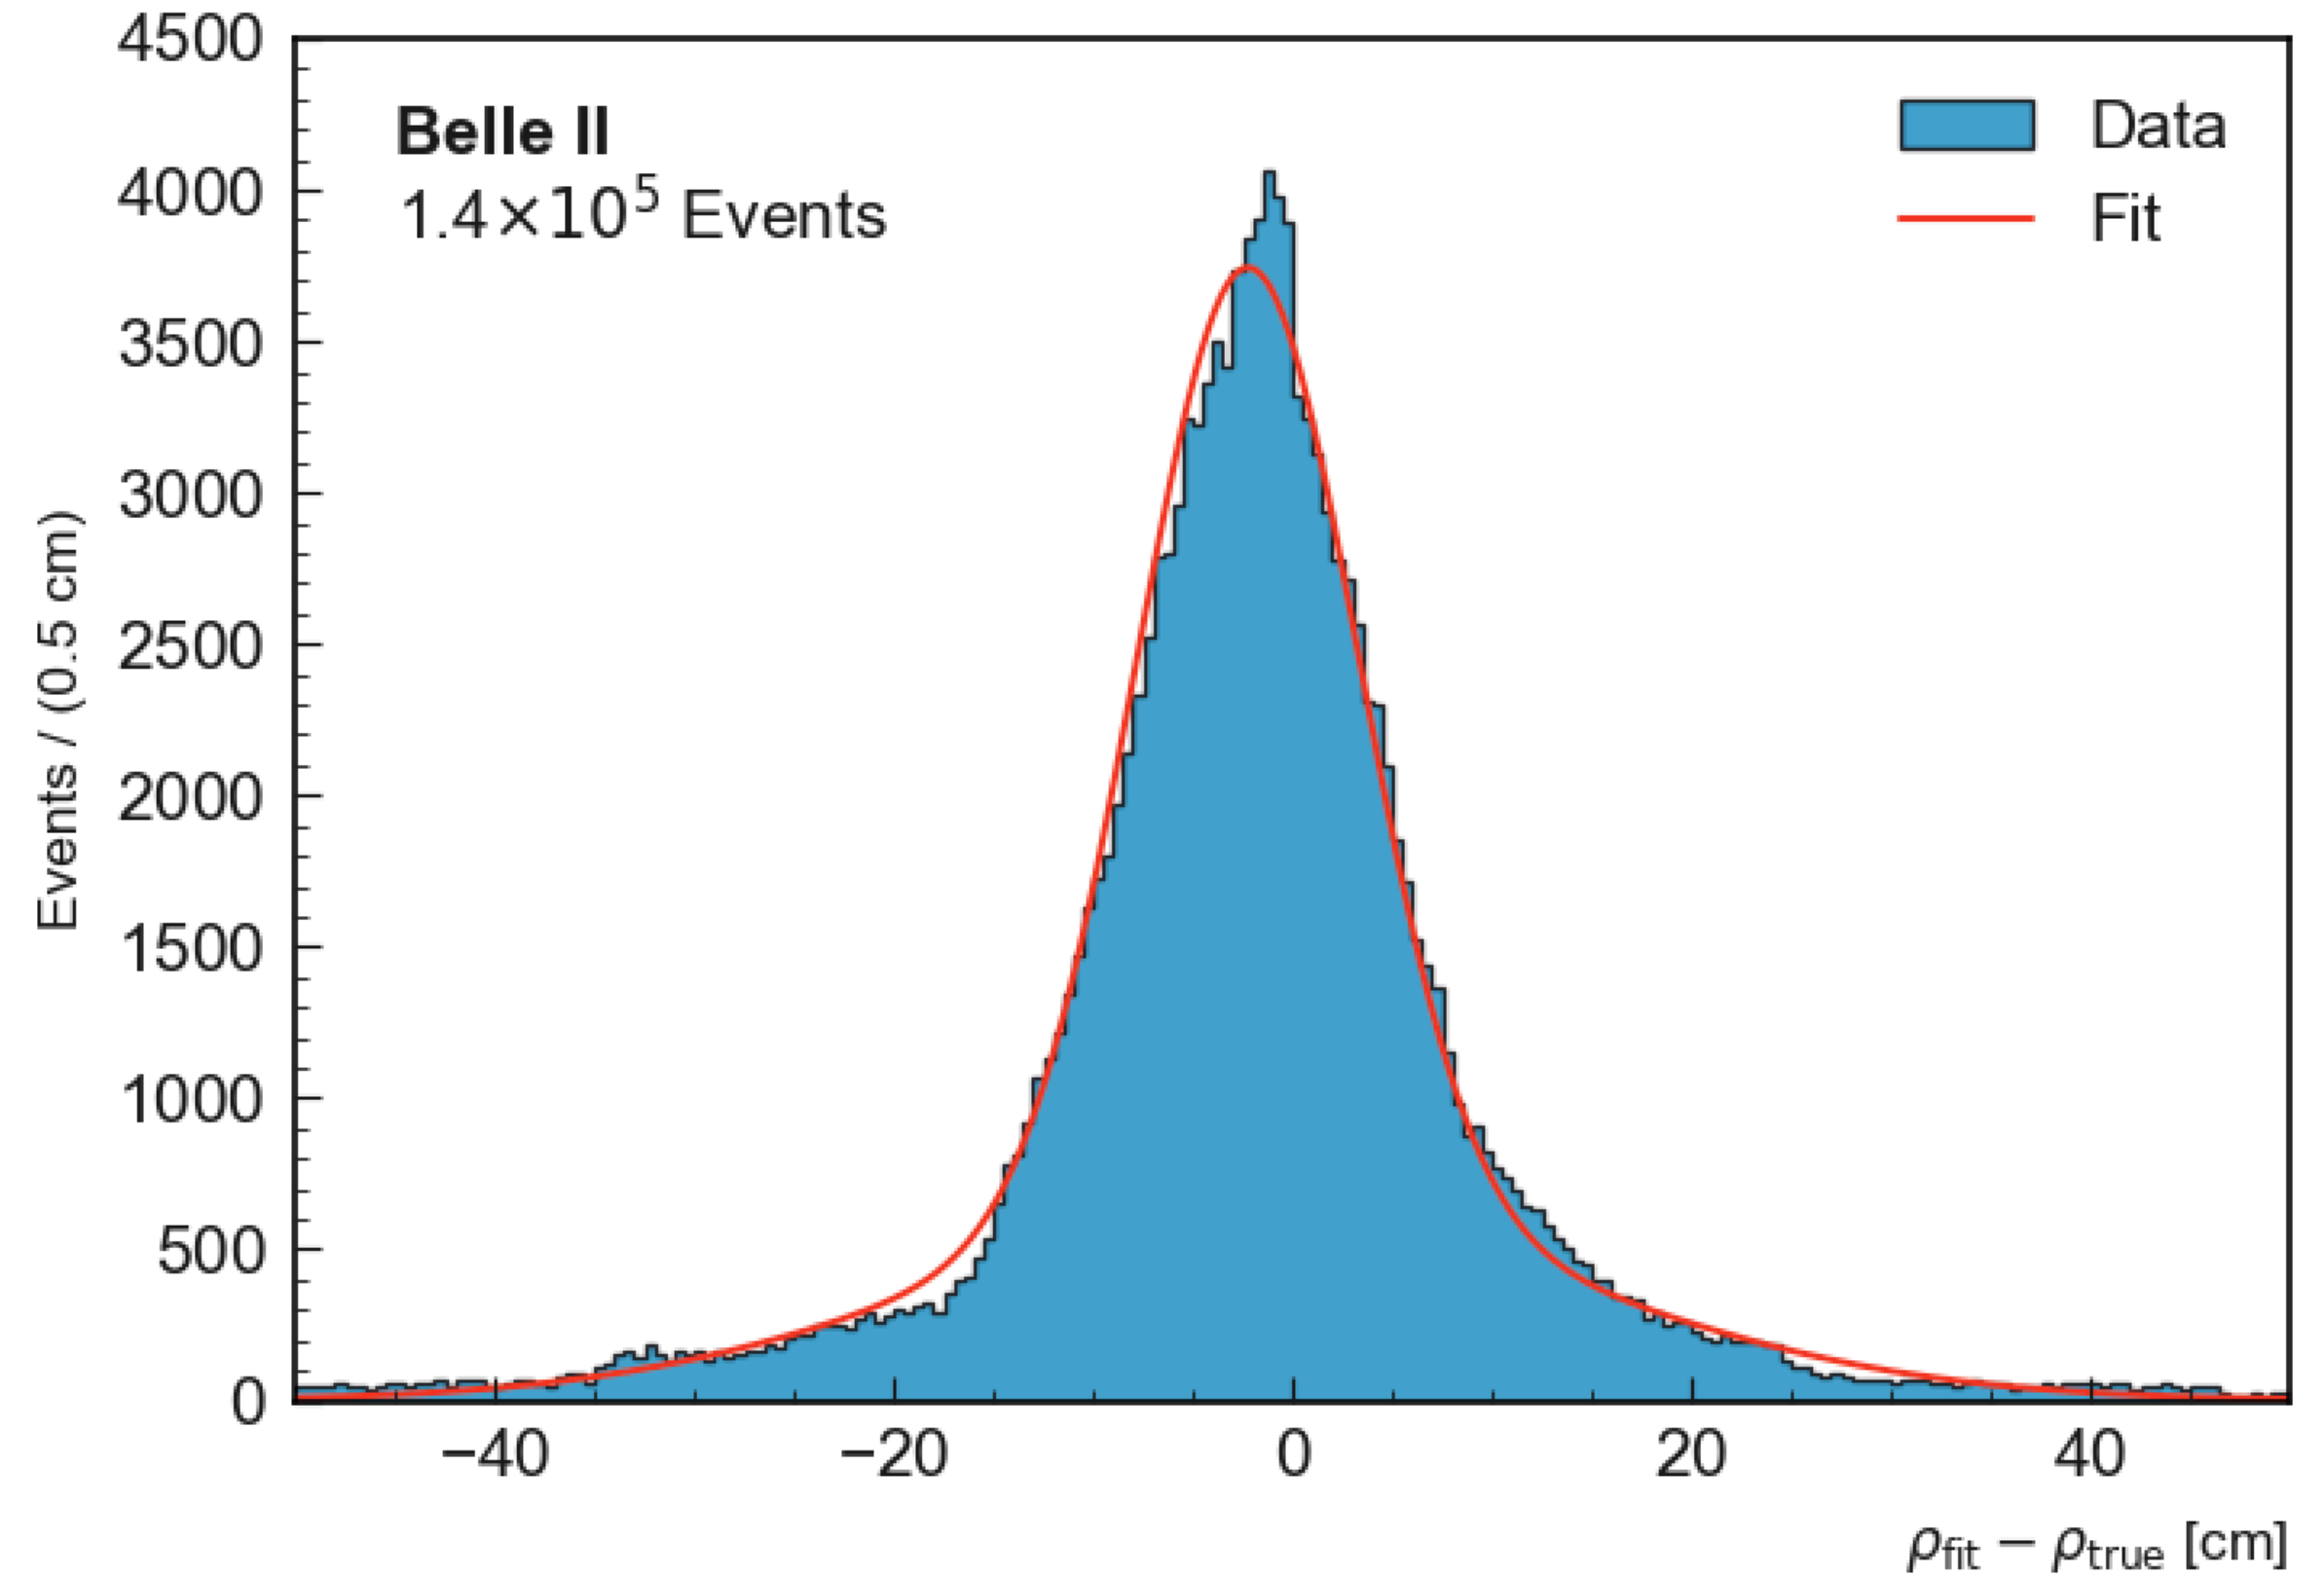

- ◆ ~400 reference vertices (MacroCells)
- ◆ Hough transforms in parallel, assuming MacroCell as vertex
- ◆ Select promising vertex candidate

Problem

- ◆ Hough transform meant to fit two parameters
- ◆ Four parameters need to be fitted, two from vertex
- ◆ Strong bias towards far-away vertices
- ◆ Smarter algorithm needed
- ◆ **Neural cluster analysis**

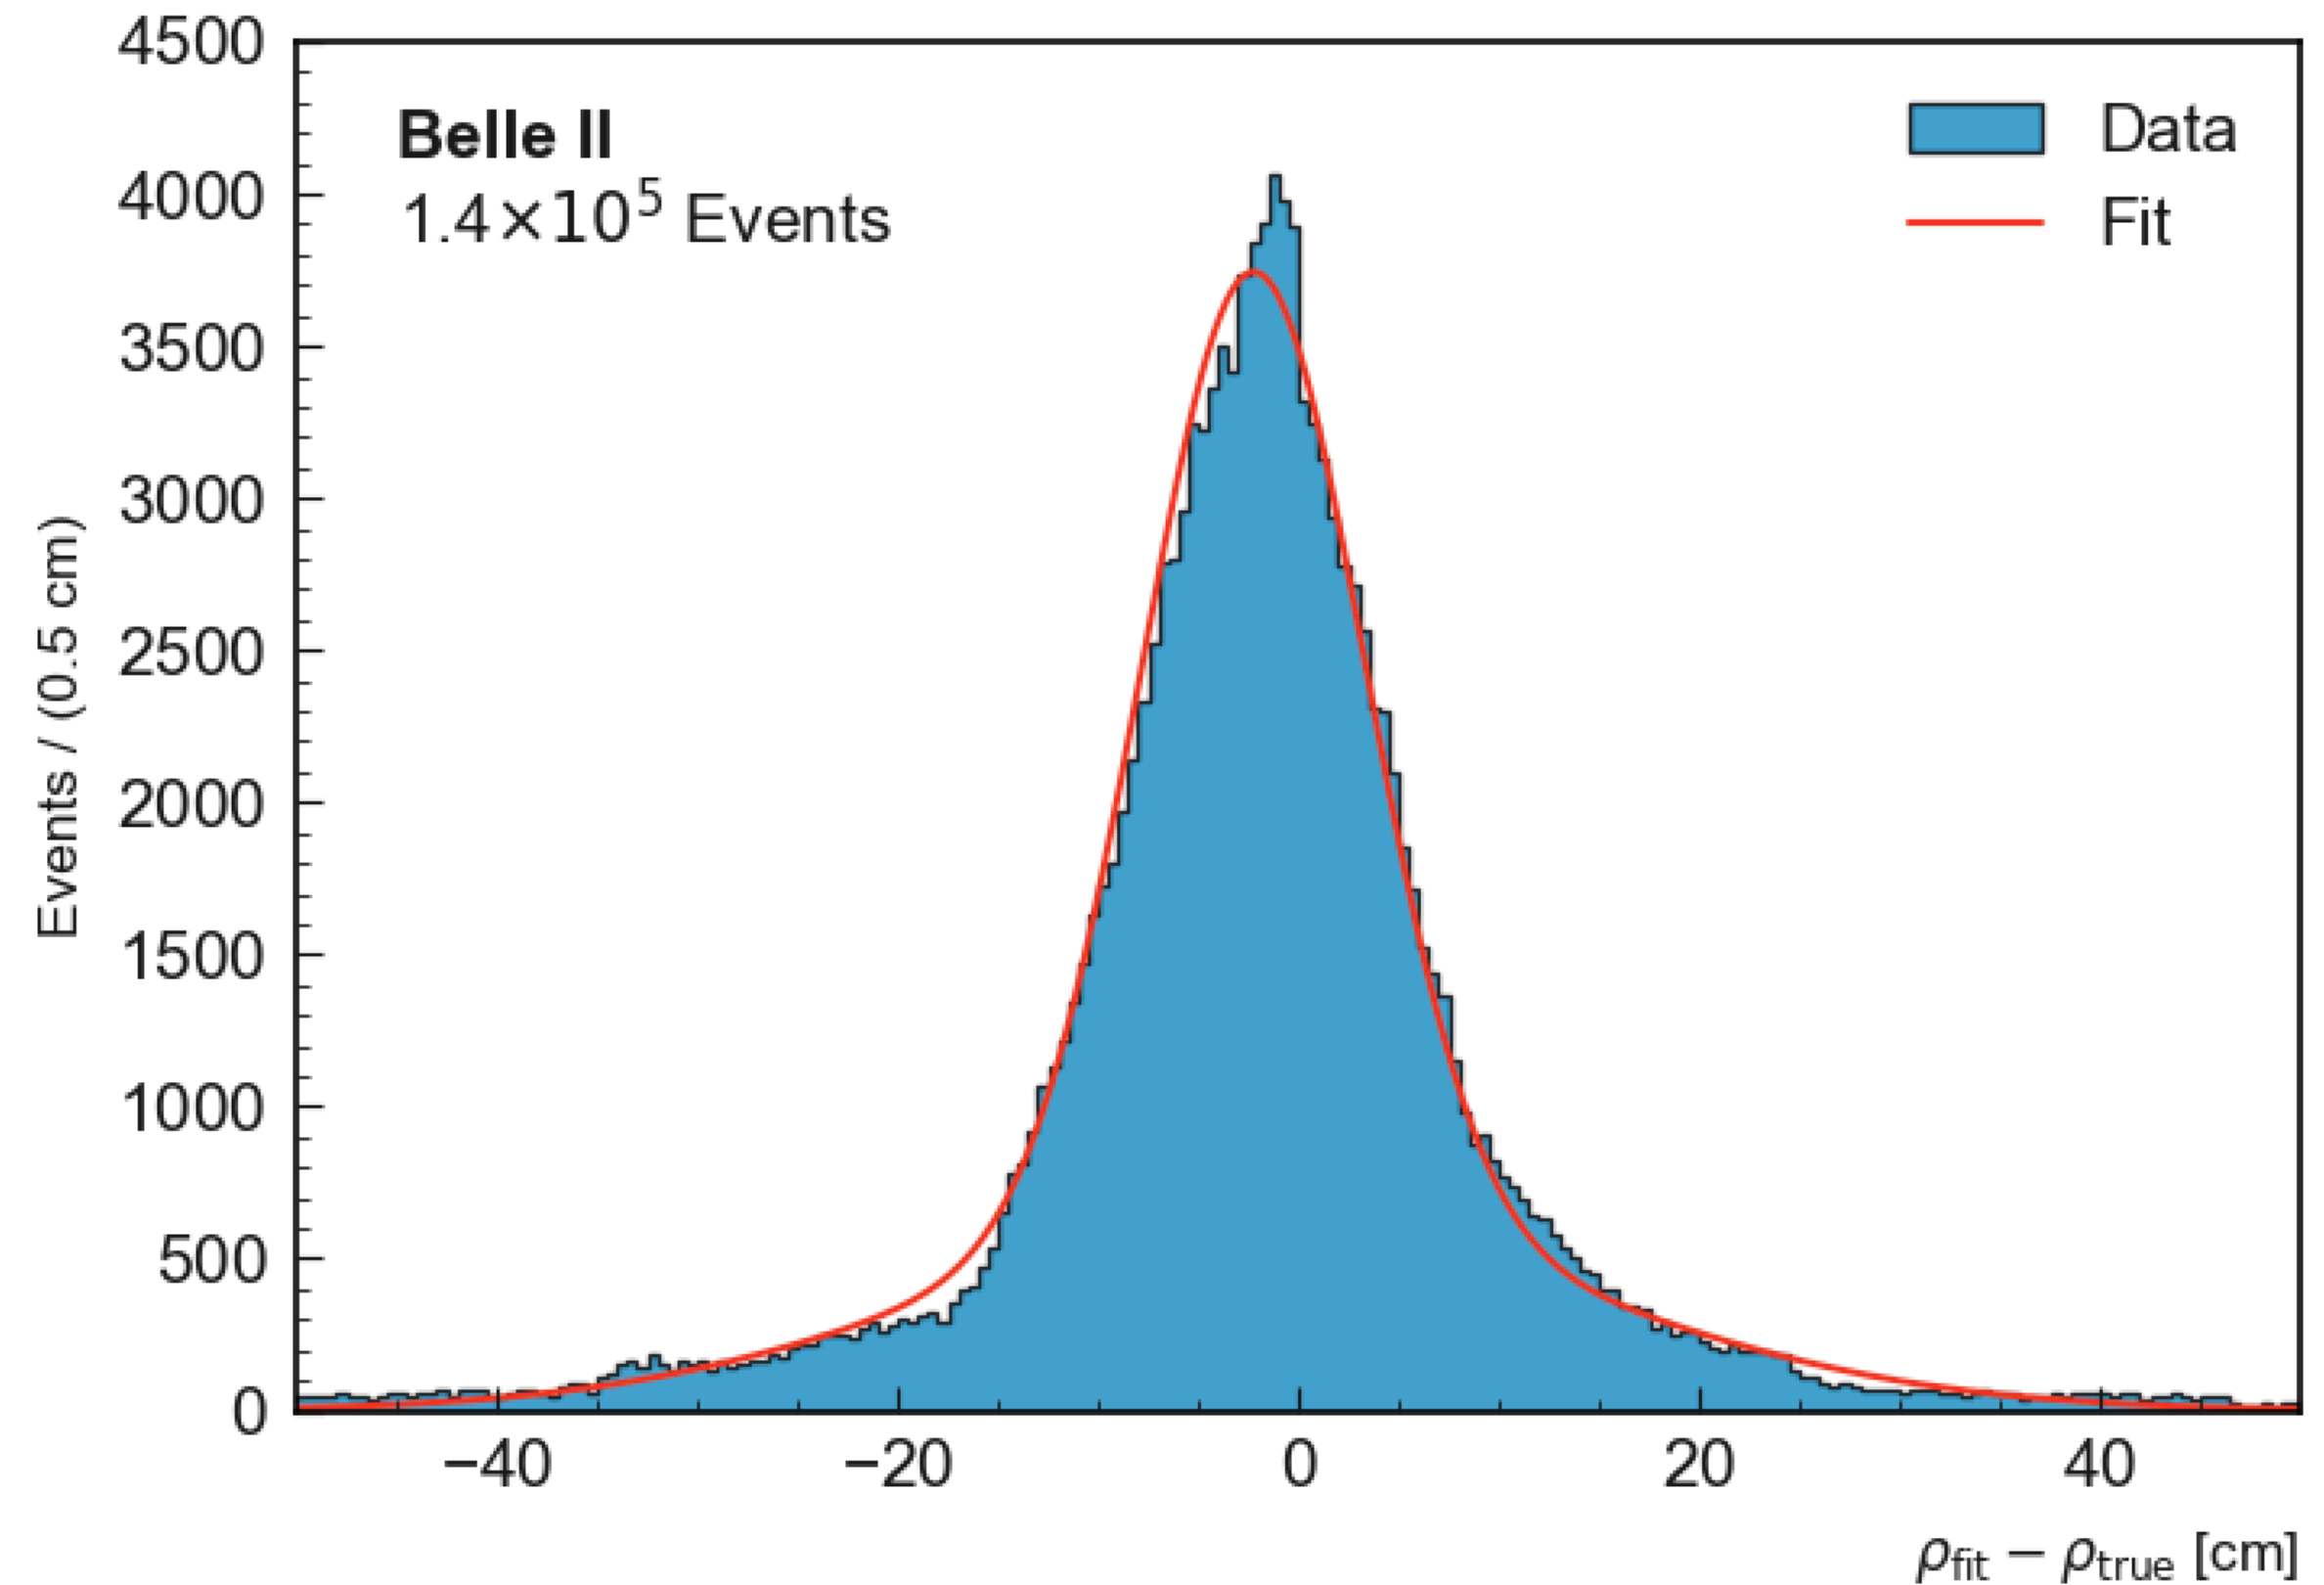

- ◆ Network runs on cluster parameters (size, σ , peak height, etc...)
- ◆ Classifies clusters [tracks, fakes]
- ◆ Requires two tracks
- ◆ Training data: iDM + background

- ◆ Signal efficiency: ~80%
- ◆ Fake rate should not exceed 1kHz
- ◆ Vertex resolution: ~5cm

- ◆ Signal efficiency: ~80%
- ◆ Fake rate should not exceed 1kHz
- ◆ Vertex resolution: ~5cm

- ◆ Implementation of FPGAs
- ◆ In collaboration with KIT-ITIV
- ◆ DVT planned to be ready for next running period
