A Leptonic ALP

(Axion-like Particle)

① ALP coupling to electrons

- $\mathcal{L} = -iag_e \bar{e} \gamma_5 e$
- Pseudoscalar

① ALP coupling to electrons

- $\mathcal{L} = -iag_e \bar{e} \gamma_5 e$
- Pseudoscalar
- ALP mass $m_a > 2m_e$
 - ALP is „visible“
 - $a \rightarrow e^+ e^-$

① ALP coupling to electrons

- $\mathcal{L} = -iag_e \bar{e} \gamma_5 e$
- Pseudoscalar
- ALP mass $m_a > 2m_e$
 - ALP is „visible“
 - $a \rightarrow e^+ e^-$
- Beam dump experiments (NA64, ...)
- Piondecay (SINDRUM, ...)

Beam Dump: E137

② ALP coupling to muons

- $\mathcal{L} = -iag_\mu \bar{\mu} \gamma_5 \mu$

② Addressing ($g - 2$)

- $\mathcal{L} = -ia g_{\mu\bar{\mu}} \gamma_5 \mu$

- Tension

Experiment vs. Theory

② Addressing ($g - 2$)

- $\mathcal{L} = -ia g_{\mu\bar{\mu}} \gamma_5 \mu$

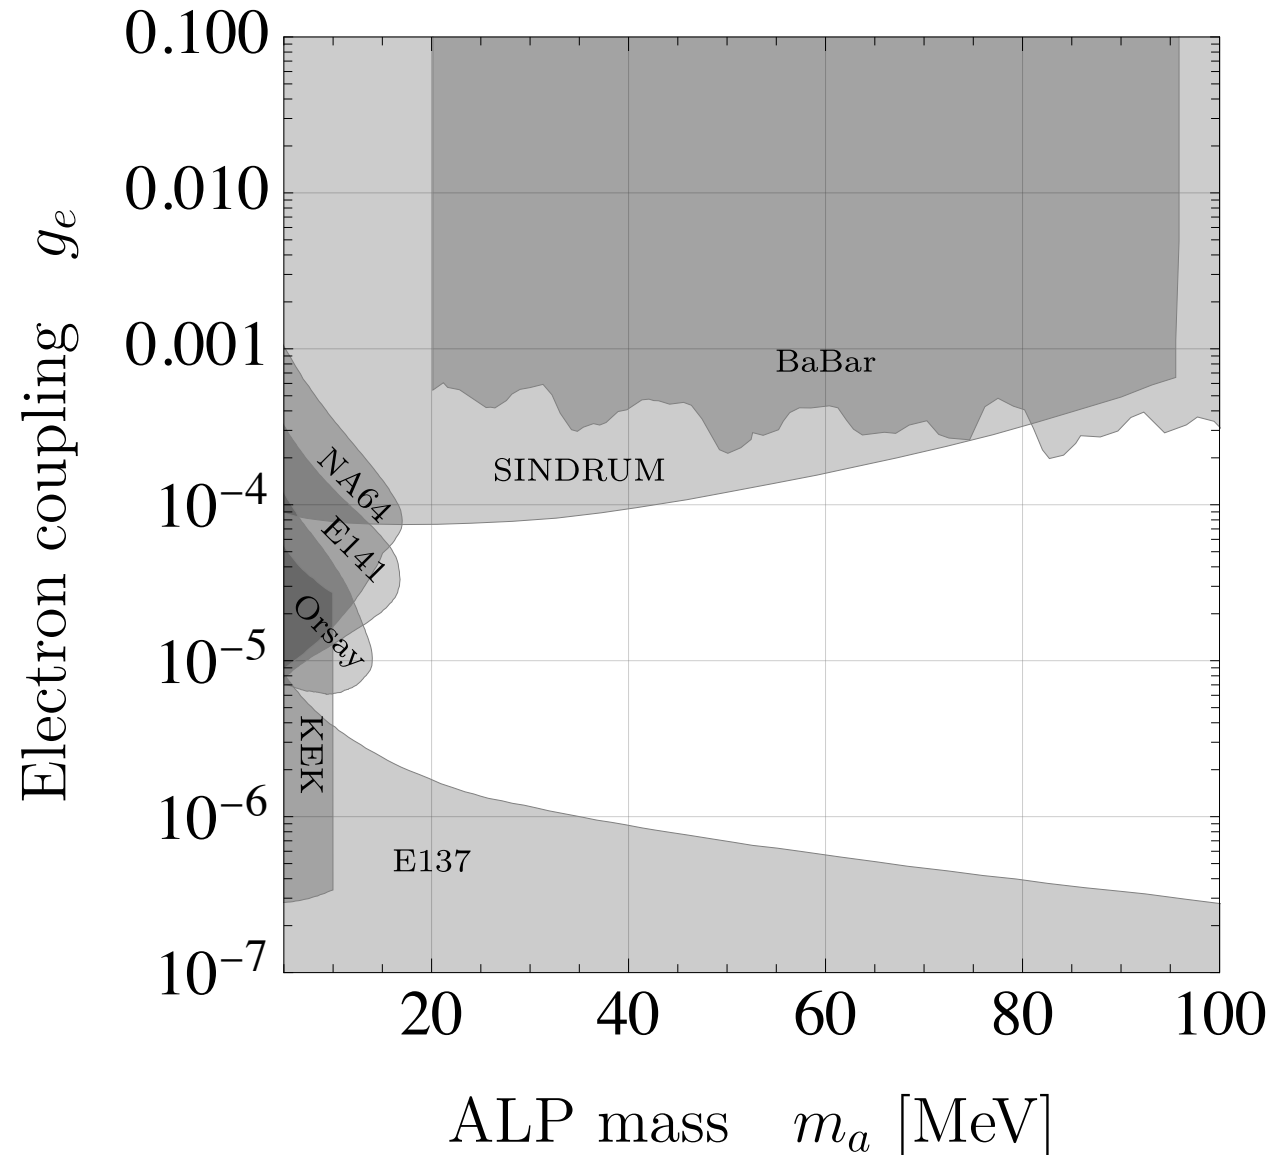

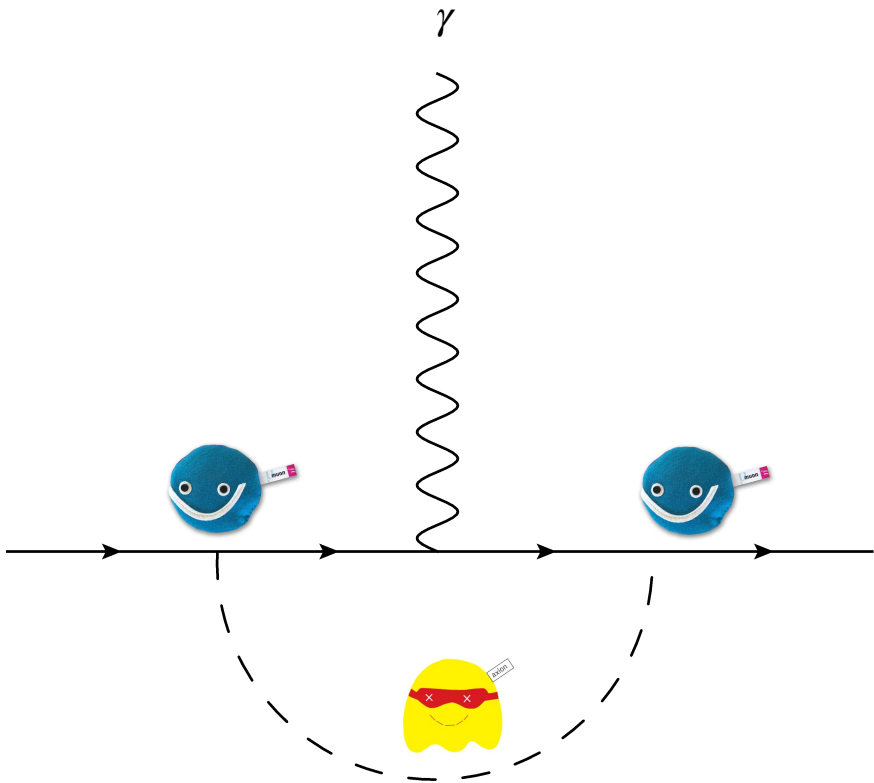

- Tension

Experiment vs. Theory

② ALP coupling to muons

- $\mathcal{L} = -ia g_\mu \bar{\mu} \gamma_5 \mu$
- 4D-Plot: m_a, g_e, g_μ, g_τ

② ALP coupling to muons

- $\mathcal{L} = -ia g_\mu \bar{\mu} \gamma_5 \mu$
- 4D-Plot: m_a, g_e, g_μ, g_τ
- Blue:
($g - 2$) only doable for some g_e

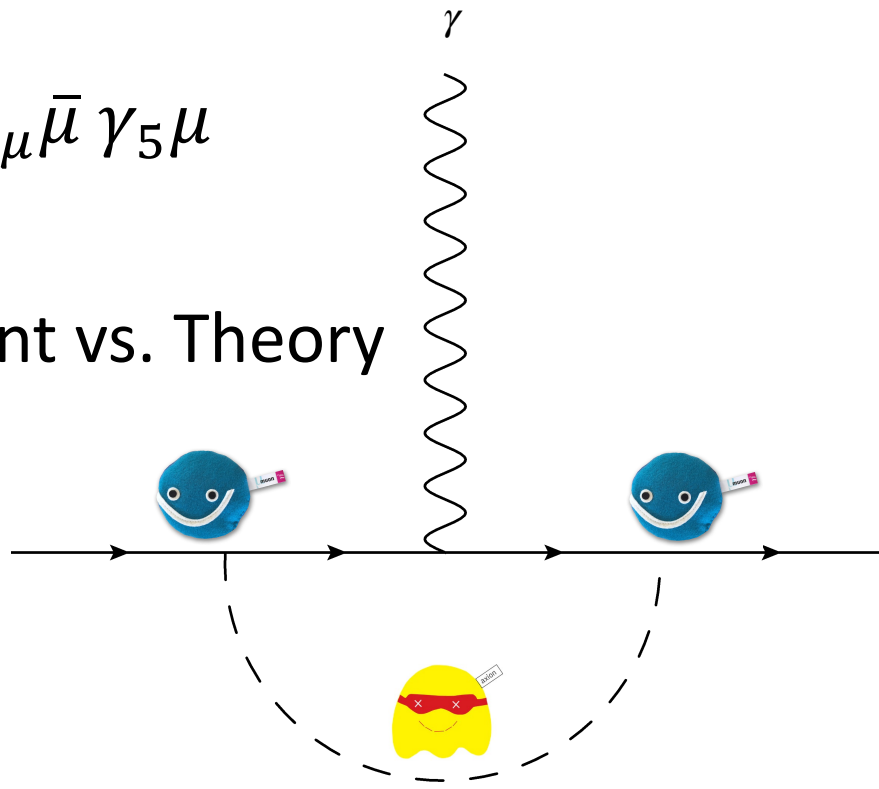

③ Addressing ($g - 2$)

- $\mathcal{L} = -ia g_{\mu\bar{\mu}} \gamma_5 \mu$

- Tension

Experiment vs. Theory

③ ALP coupling to tau leptons

- $\mathcal{L} = -ia g_\mu \bar{\mu} \gamma_5 \mu$
- 4D-Plot: m_a, g_e, g_μ, g_τ

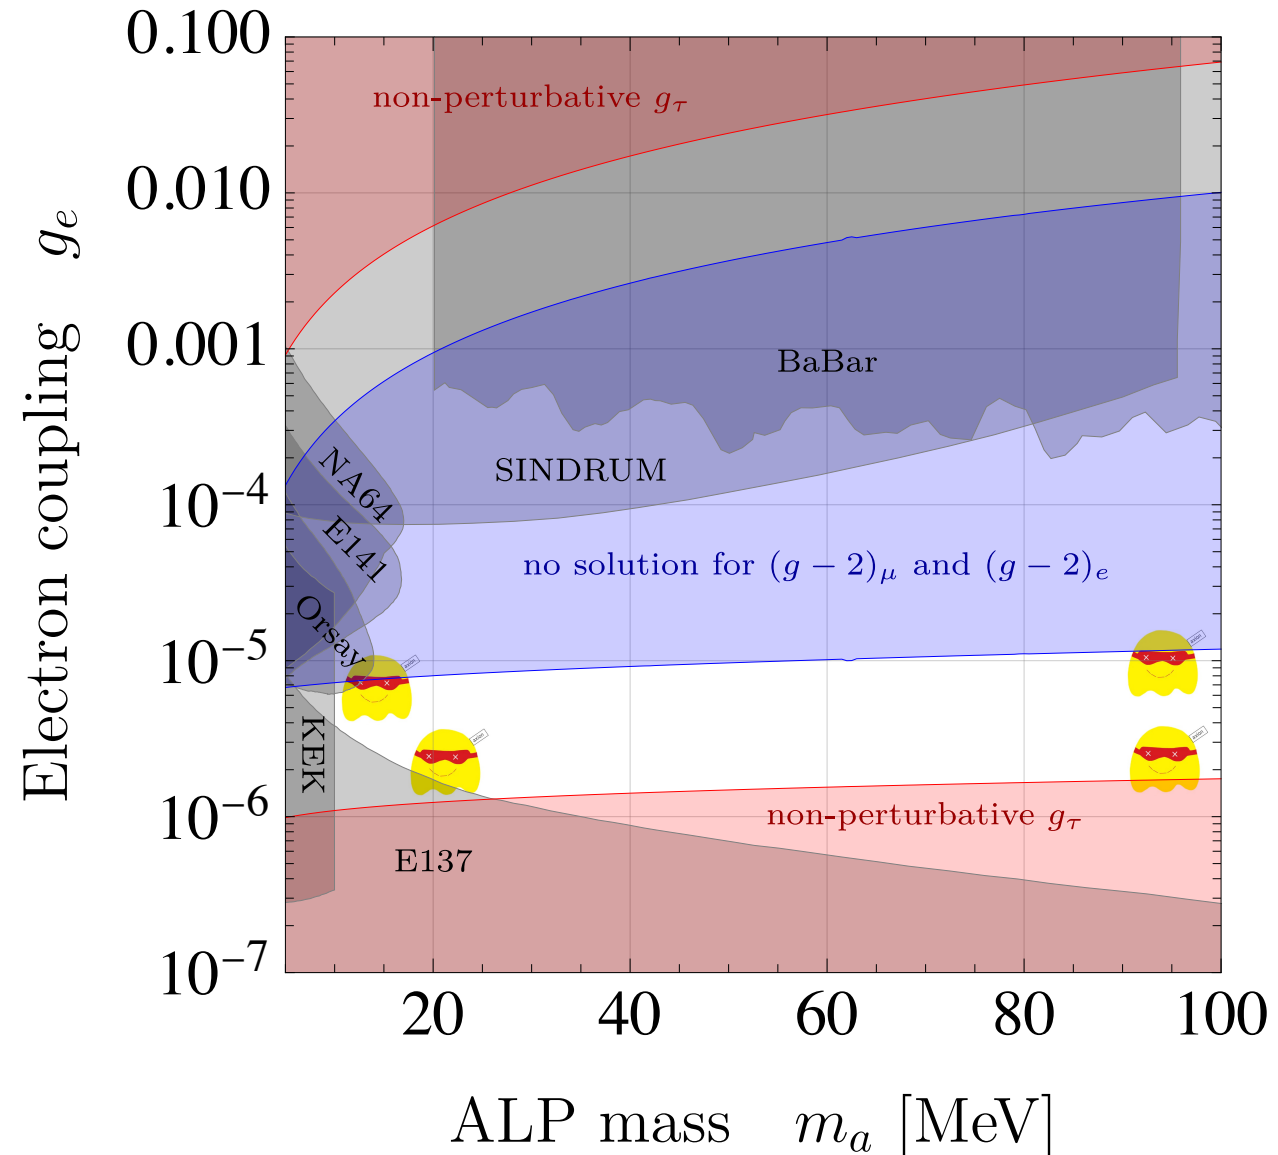

③ ALP coupling to tau leptons

- $\mathcal{L} = -iag_\mu \bar{\mu} \gamma_5 \mu$
- 4D-Plot: m_a, g_e, g_μ, g_τ
- Blue:
 - ($g - 2$) only doable for some g_e
- Red:
 - Required g_τ too large

Summary

- 4 viable benchmark ALP models
- Visible ALP ($a \rightarrow e^+ e^-$)
- Purely leptonic
- Address ($g - 2$)

Outlook

- 2 viable benchmark ALP models
- Visible ALP ($a \rightarrow e^+ e^-$)
- Purely leptonic
- Address ($g - 2$)
- Dark Matter portal
